Live View 40
TLDR 43

App Structure

The demo app is organized into three (3) main functional sections namely **Configurations**, **Scheduling/Time** & **Viewing** that together support end-to-end order.

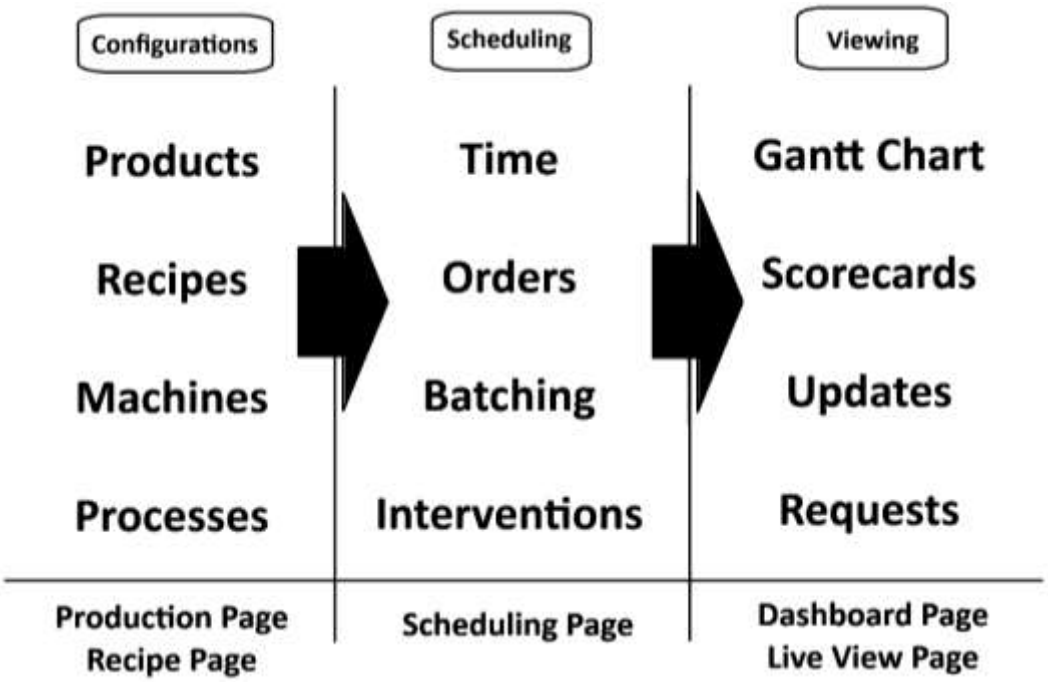

Figure 1: High Level View

On the left, the Configuration side contains the data the user maintains: Products, Recipes, Machines and Processes. This configuration is done mostly on **Production Page** & **Recipe Page** is used to drive downstream calculations. In the center, the app transforms those configurations into executable plan content via **Scheduling Page**. This is shown as Time w/ Orders, Batching & the Interventions that let the user insert, production time reflow, reorder or adjust production batches. On the right, the app views & summarizes the plan. The **Dashboard Page** & related viewing pages (**Live View Page**) present a bird's-eye timeline & KPIs such as Total Batches, Total Output (in packages) & plan time ranges, along w/ Updates and Requests to reflect changes made during scheduling.

Pages

Below are the web pages that comprise the Demo App. These pages are what makes the Order Production Planner App work & are of course quite different than the Excel Spreadsheet file being used but it still has the workings of the spreadsheet.

Dashboard Page – is the page where the User can see the Bird's Eye View of the Order Production Plan and its proceedings.

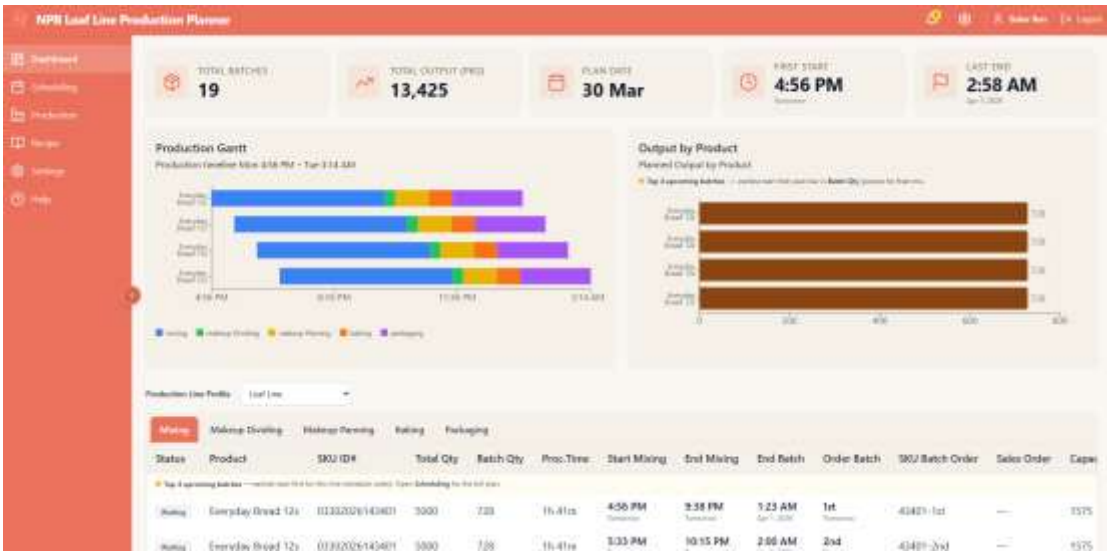

Figure 2: Dashboard Page

It contains four (4) Scorecards that are namely "Total Batches", "Total Output (in packages)", "Plan Date", "Start Time and Date" and "End Time and Date". These scorecards are below the Top Menu Bar & is above the Production Gantt Chart & "Output by Product Chart. The said Scorecards are responsible for giving the fast total detailed view & summary of the current Order Production Plan.

Figure 3: Scorecards

Below the scorecards, the Dashboard provides visualizations that turn the schedule into an easy-to-read story such as: **Production Gantt Chart** - a timeline view where each batch is displayed across the day, segmented by its stage durations (e.g. Mixing, Makeup Dividing, Makeup Panning, etc.). This chart is used to spot overlaps, long-running batches & stage-heavy SKUs at a glance. **Output by Product** - a summary chart that aggregates planned output per product/SKU so the user can confirm the plan's distribution (what dominates the day, what is missing & whether totals look correct).

Figure 4: Charts

The Dashboard also has notification updates found at the Top Bar right side: **Updates** – notifies for any change request from the **Live View Page** section so users can understand what changed and why. **Requests** – details of the items raised by users (or the floor) that may require schedule adjustments, approvals or follow-up actions.

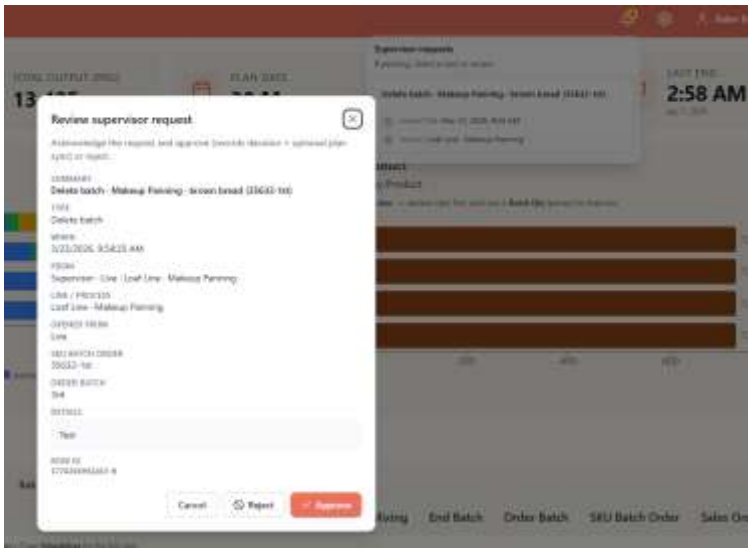

Figure 5: Updates and Requests from Live View

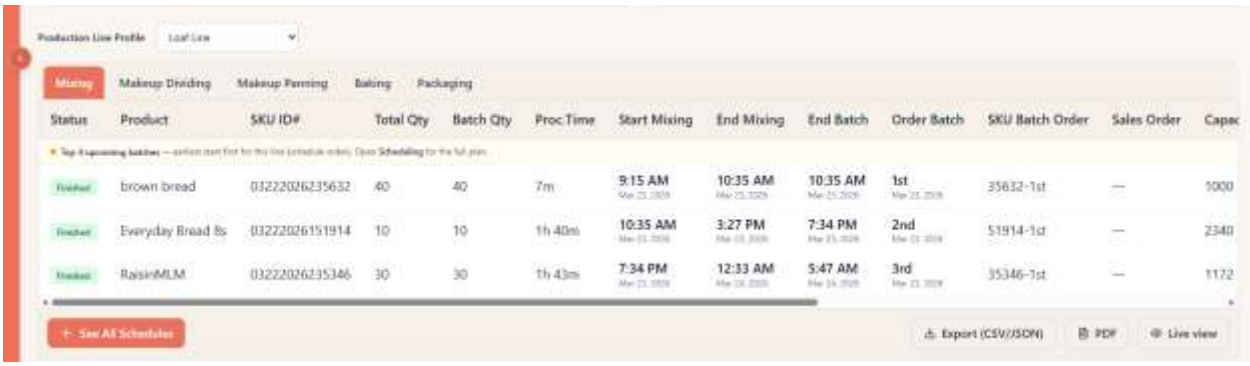

Figure 6: Production Line Stage Table

After the scorecards and the Production Gantt / Output by Product charts, the Dashboard includes a line-and-stage section:

- **Production Line Profile** - dropdown to pick the line (e.g. Loaf Line). All rows in the table are for that line.
- **Process tabs** - same line's processes (Mixing, Makeup Dividing, Makeup Panning, Baking, Packaging). Each tab shows the **"PlanTable"** filtered/scoped to that process stage w/column labels that match that stage (e.g. under Mixing: Start / End Mixing style labels come from shared PlanTable & legacy process mapping).
- **Banner** - explains that only the top upcoming batches (e.g. top 4) are shown, earliest start first, and that the full plan is in Scheduling.
- **Table** - batches w/status, product, SKU ID, quantities, proc time, stage/start/end times, order batch, SKU batch order, sales order, capacity, production status, etc.
- **Footer actions** – "See All Schedules" redirects to Scheduling Page. "Export / PDF" are wired in the demo (may show a notice modal). The "Live View" jumps to the **Live View page** for that line and that process tab.

In short, the **Dashboard Page** is the read-focused command center. it provides fast totals, plan boundaries, and clear visuals that reflect the latest Scheduling decisions.

Scheduling Page - is where the user actively builds the production plan. It is the main workspace for converting product demand into time-ordered batches. One of the key responsibilities of this page is to create production orders (batches) for a selected production line and date. Others would be:

- **Split batches automatically** using configured capacity/yield rules:
    - **Total Quantity splitting** (when Yield is configured): breaks a total quantity into batches based on yield-per-batch.
    - **Theoretical Output splitting**: computes output from Sales Order plus allowances (loss/excess/samples/carry-over logic) and splits by capacity.
- **Compute schedule timing fields** per batch. **Start Time** (labeled "Start Sponge" in the demo but treated as the batch **Start Time**). **End Dough**: computed based on the product's Recipe config for w/c process defines "end dough". **End Batch**: computed using total process minutes across the full process chain
- **Reflow / adjust schedules** are reordering batches can trigger downstream time shifts so later batches remain consistent. Insert time blockers/interventions that move the timeline (e.g. cleaning, downtime, buffer).
- **Support pipelined batching** where if pipeline breakpoints are configured in process profiles, page can stagger batch starts instead of forcing strict back-to-back "end-to-start" batching.

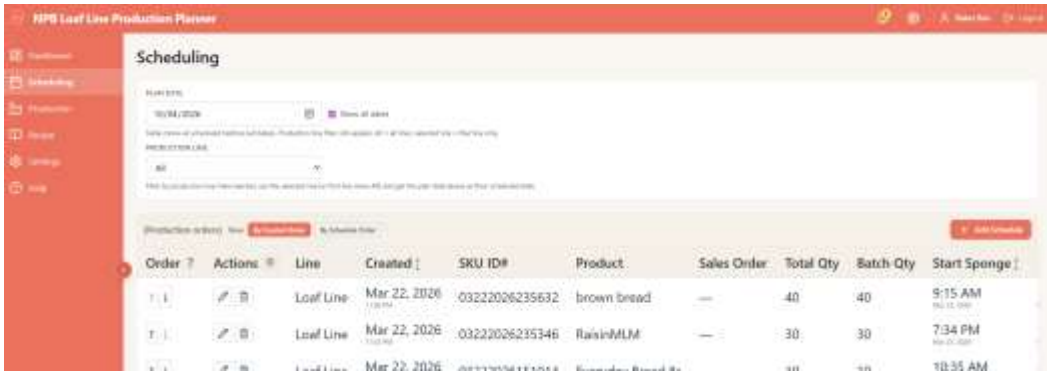

Figure 7: Scheduling Page

The **Scheduling Page** is the system's "engine room". It's where **orders + batching rules + time logic** combine to create the plan that all other pages visualize.

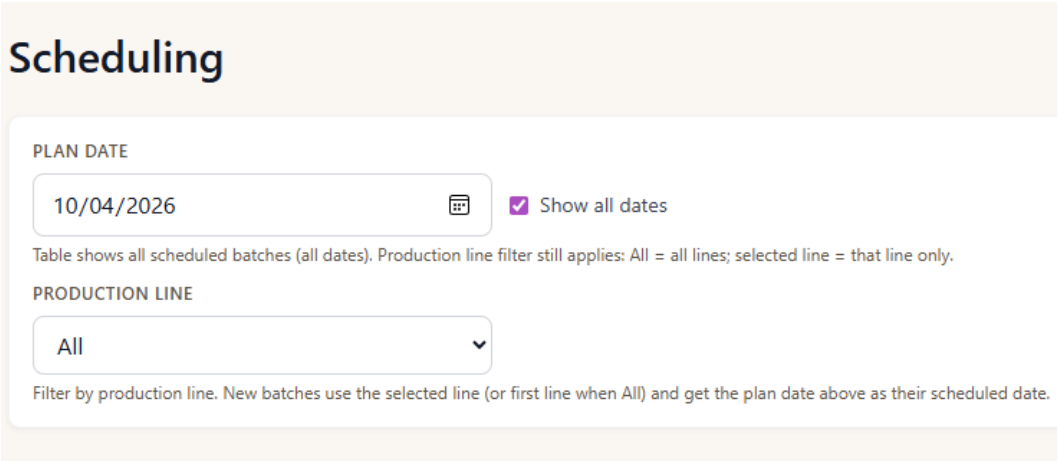

Figure 8: Header filters

Header filters would be the first part of Scheduling Page at the top that you will notice:

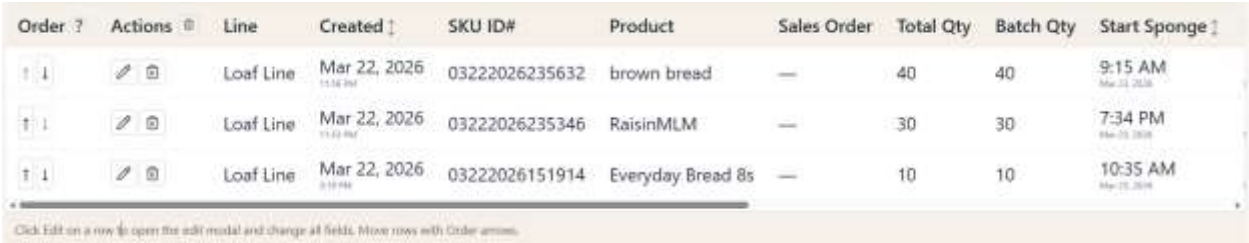
- **Plan date** - drives w/c date new batches get when you add a schedule & w/c scheduled rows appear in the table. When Show all dates is off, rows appearing in the table changes based of Plan Date value also.
- **Show all dates** - when checked, the table lists all scheduled batches on any date, while the production line dropdown still narrows (or widens) by line.
- **Production line** - All vs a specific line, the helper text is accurate: new batches pick the selected line, or the first line when All is selected, and use the plan date as their scheduled date.

So the Plan date control and 10/04/2026 in the screenshot are still meaningful even w/Show all dates on. They matter for new rows and for the alternate mode where the table is date-scoped.

Figure 8: Production Orders Bar

Production orders bar would be after the Header Filters and above the Schedule Table:

- **By Created Order / By Schedule Order** - switches the table toward schedule-oriented sorting (it sets sort on Start Sponge ascending). By Created Order is for "when did we enter this row" not "when does production start."
- **Add Schedule** - opens the add schedule flow. It's disabled if there's no line available for a new batch.



Order ?	Actions	Line	Created	SKU ID#	Product	Sales Order	Total Qty	Batch Qty	Start Sponge
↑ ↓		Loaf Line	Mar 22, 2026	03222026235632	brown bread	—	40	40	9:15 AM
↑ ↓		Loaf Line	Mar 22, 2026	03222026235346	RaisinMLM	—	30	30	7:34 PM
↑ ↓		Loaf Line	Mar 22, 2026	03222026151914	Everyday Bread 8s	—	10	10	10:35 AM

Click Edit on a row to open the edit modal and change all fields. Move rows with Order arrows.

Figure 9: Schedule Table

Schedule Table is the main component of Scheduling Page & it deals w/all Schedules like Production Order Batches & even "Time blockers" like Manpower Breaktime, Maintenance Time, Cleaning Time, etc. depending on User's input.

- **Order column** - move rows w/swap logic that can prompt if many rows or cross-day effects (moving of a batch to another batch but has a 1-day range of swap.
- **Actions** - edit (modal w/full fields) & per-row delete. There's also a bulk delete affordance in the header area.
- **Line, Created, SKU ID#, Product, Sales Order, Total Qty, Batch Qty, Start Sponge Columns** - the Start Sponge label is the first process timing column for the first process stage (e.g. Mixing) on the Loaf Line (same conceptual family as

the Dashboard Page's PlanTable, but here it's the master schedule list, not the "top 4 per tab" snapshot).

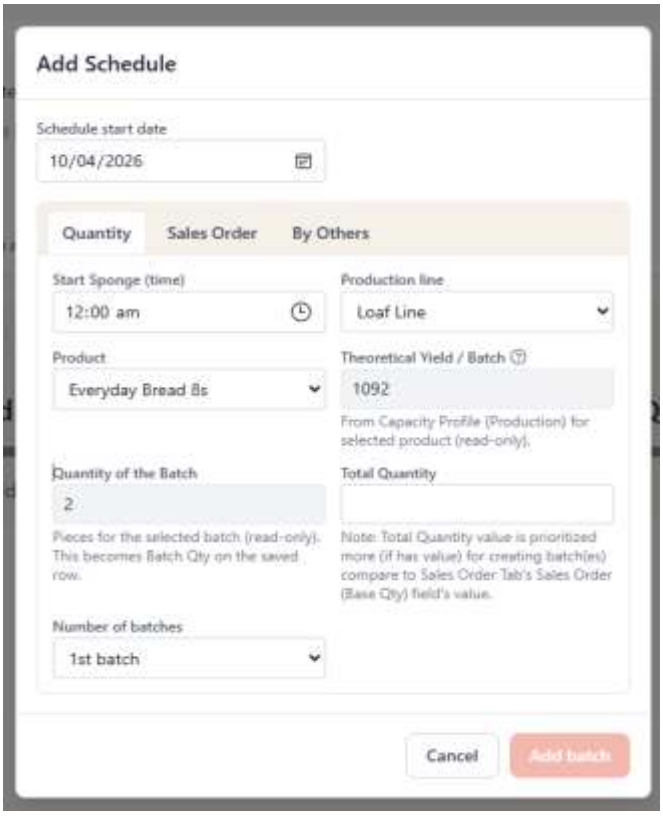


Figure 10: Add Schedule Row Modal

Schedule Row Modal – is a modal that shows when "Add Schedule" button is clicked. This is the core function of the Scheduling Page in order to have Schedules like Batches and Time blockers in the Schedule Table. This modal does have tabs but it has shared fields across tabs also like **Schedule start date** - calendar date for the new row (matches the page's plan date when you open the modal). **Start Sponge (time)** on **Quantity** & **Sales Order** - same underlying field, this is the anchor time for the first stage (labeled "Sponge" here because the app still uses that naming for the mixing anchor in several places). Downstream End Dough / End Batch (and reflow) are computed from these plus recipes, line profiles, stagger, etc. And lastly, **Production line** & **Product** - line drives which recipes appear in the product dropdown; changing line clears product.

Tab 1: Quantity

You specify how many pieces total & let the app split into batches using theoretical yield per batch from the capacity profile for that product on that line. When proceeded to Add Batch button filling this tab only, it's considered a single SKU order but if Sales Order Tab is not filled, it will be an order w/o details but if Sales Order Tab's fields have values, the Quantity Tab's Total Quantity value will be the basis of doing batches instead even if the

Sales Order (base qty) field has value but all the details in the Sales Order Tab will be included in SKU order creation:

- **Theoretical Yield / Batch** - read-only, shows until product (& line) are set.
- **Number of batches** – it is "ceil(totalQty / yield)", the dropdown picks w/c batch slice you're adding (1st, 2nd, ...).
- **Quantity of the Batch** - read-only piece count for that slice. Becomes Batch Qty on the saved row.
- **Submit button enables when** product, line, date, start time are set & total quantity > 0 & yield exists and is > 0.

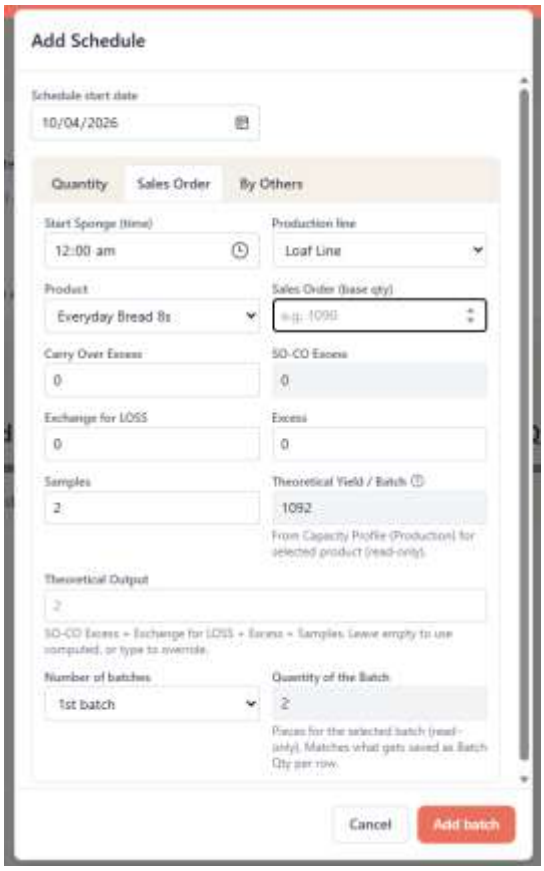

Figure 11: Sales Order Tab

Tab 2: Sales Order

Same anchor time / line / product, but demand is expressed through sales-order style fields such as **SO-CO Excess** - read-only, computed as max(0, Sales Order (base qty) − Carry Over Excess). **Theoretical Output** - default is SO-CO Excess + Exchange for LOSS + Excess + Samples (with Sample**s** defaulting to 2 in that computed sum when you don't override). You can type a number in Theoretical Output to override the computed value (the placeholder shows the computed value). **Theoretical Yield / Batch** - again from capacity profile. Used w/capacity to validate the sales-order path. **Submit enabled when** the **effective theoretical output** is > 0 **and** get Capacity for Product returns a positive capacity (can user Theoretical Output), plus the usual line/date/start/product.

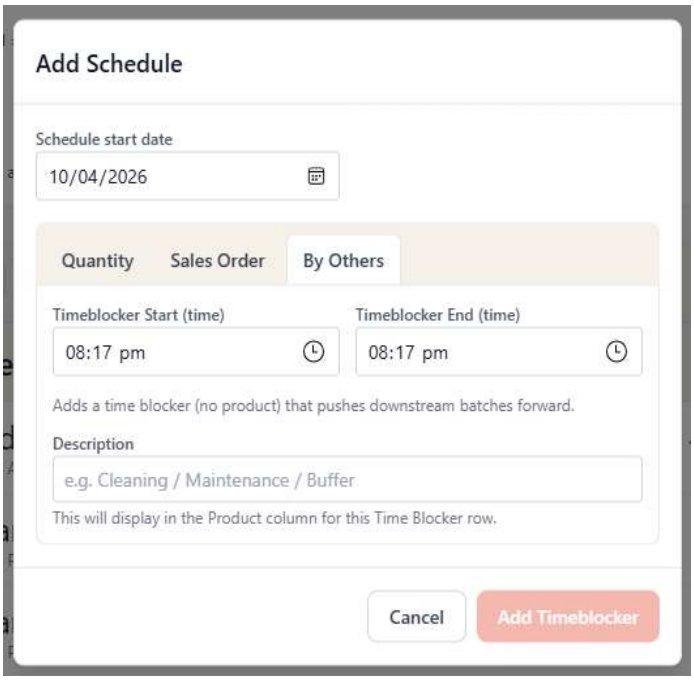

Figure 12: By Others Tab

Tab 3: By Others (Timeblocker)

No product but Time blocker Start & Time blocker End mapping to Start Sponge & End Batch. Helper text matches the code. Adds a time blocker that pushes downstream batches forward called **Schedule Reflow**, same family of logic as swaps & conflict resolution. Submit enabled when line, date, both times are set & end time is strictly after start (endM <= startM disables the button). The button label switches to Add "Time blocker". Description is what shows in the Product column for that row.

Time Conflicts Auto-Handling

If the new time overlaps existing work on the line, the app can open a "Time Conflict Affecting Other Batches" dialog: you can proceed with a snap and push of later rows directly tied to the scheduling/reflow behavior you've been debugging.

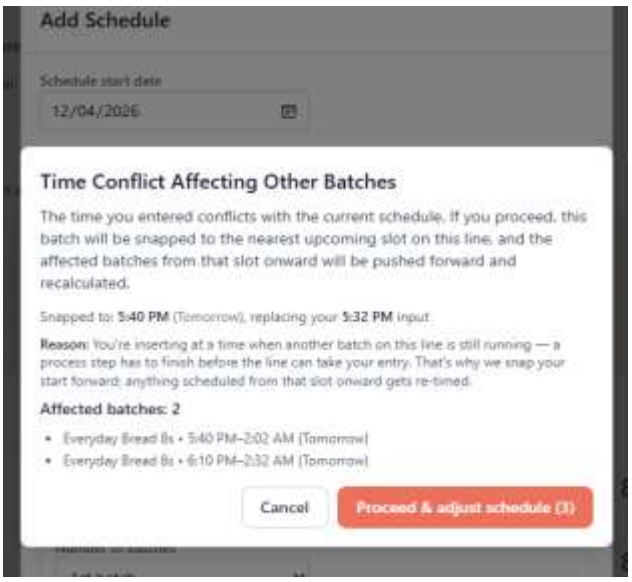

Figure 13: Time Conflict Proceed

Production Page - is the primary configuration page for how a production line works. It defines the parameters that Scheduling relies on to split quantities, compute batch durations, and enable pipelining. It typically contains:

A) Production line configuration

- The user selects a **Production Line** (e.g. Loaf Line, Buns Line).
- Each line maintains its own configuration, so products on different lines can have different capacities, process steps, and profiles.

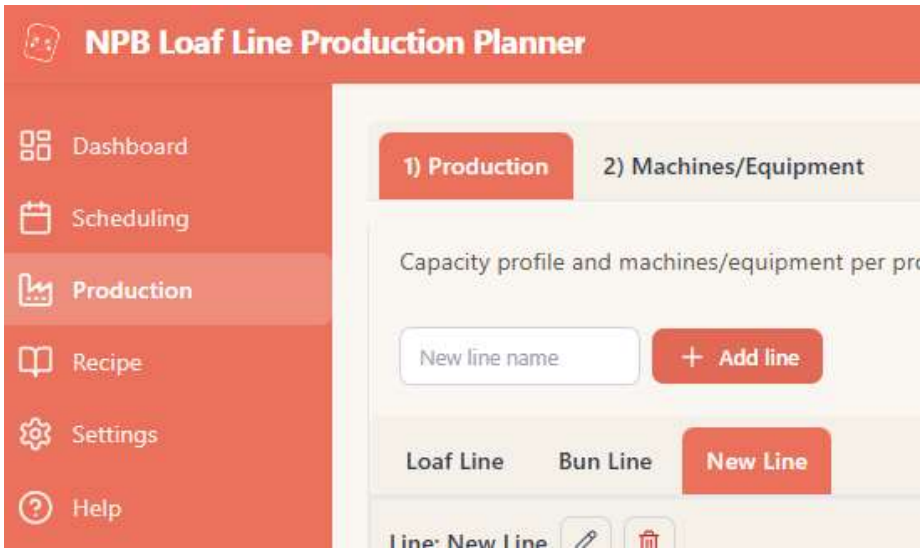

Figure 14: Production Line

B) Capacity Profile (per product, per line)

The Capacity Profile is where the user defines the batch sizing parameters per product:

- **Capacity**: pieces per capacity-sized batch (used by capacity-based splitting).
- **Yield**: pieces per dough batch (used by Total Quantity splitting).
- Optional dough/weight parameters (for reference and later extensions).

Figure 15: Capacity Profile Line

This section ensures Scheduling can correctly compute:

- how many batches are needed
- how many pieces go into each batch (full batches vs remainder)

C) Process chain (per line)

The user configures w/c processes/stages exist on the line & their order (e.g. Mixing → Baking → Packaging). This process chain determines:

- how timing is computed across the day
- w/c stages appear in timeline visualizations like the Gantt
- what options appear in the Recipe Page for "End Dough"

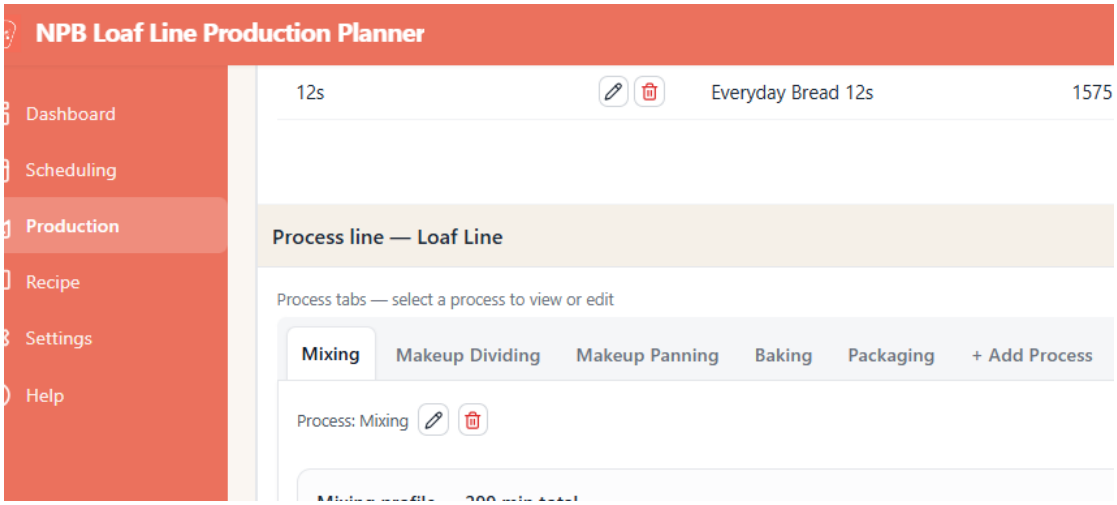

Figure 16: Process Chain

D) Process profiles (per process)

Each process can have one or more profiles that define how long that process takes and what steps make it up. Profiles contain:

- **Machines/Equipment steps** (machine name + duration)
- **Process time steps** (named durations like “Gap”, “Bench Time”, “Floor Time”)
- **Sequence/Order** values to define step order
- **Pipeline checkboxes** that define potential pipelining breakpoints for cascading (overlapping) batches & schedules reflecting at Scheduling Page & Dashboard Page’s Production Line Stage Table.

This is what makes the app modular & spreadsheet-like. Instead of hard-coded spreadsheet columns, the user configures the timing model through these profiles.

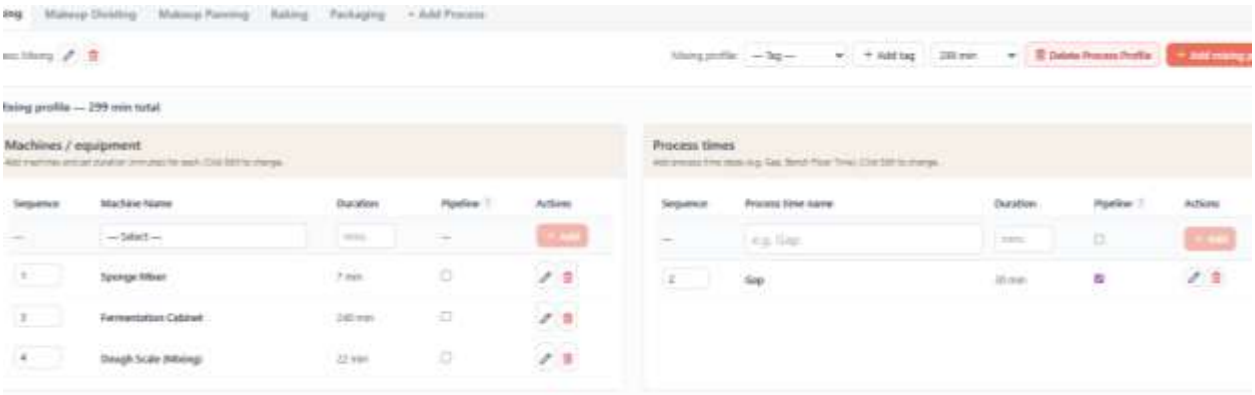

Figure 17: Process Profiles per Process

Recipe Page – this page defines each product's process timing & the "logic" needed for Scheduling to compute stage windows. Users assign durations per process (or link a product to process profiles) & choose w/c process represents End Dough for that product. This page is also where product naming is maintained, so it stays consistent across Scheduling & the Production page's Capacity Profile references.

Figure 18: Recipe Page

The Recipe Page is where you define products (recipes) tied to a production line, w/minutes per process stage & End Dough. The subtitle in the app is literal, these records drive the Product dropdown and Proc. Time (and related timing) on Scheduling & Dashboard.

Layout

- Page title: Recipe.
- Recipes Card: toolbar w/Add recipe (opens a dialog; not the inline table).
- Scrollable table.

Line filter (first column header)

The dropdown in the first header cell is not a generic "category" filter - it is Production line, **All**: every recipe is listed; each row still belongs to a line (shown in the first column as that line's name, e.g. Loaf Line) or **One line**: only recipes for that line. When the filter is All, the process column headers (Mixing, Makeup Dividing, ...) come from the first line in your line list (lines[0]). If you only use one line type in practice, this matches what users expect. If lines ever differ by process set, the headers are still "template" columns from

that first line. Again, page defines also how Scheduling should interpret “End Dough” for that product. A recipe typically includes:

- **Actions** - Edit (pencil) & Delete (trash, confirmation flow).
- **Product name** (must stay consistent so Scheduling, Capacity Profile & Dashboard refer to the same SKU)
- **Production line assignment** (w/c line this product is produced on)
- **Process durations** per stage (either entered directly as minutes or derived from selected process profiles)
- **One column per process (names from Production line setup)** - each cell shows {minutes} min from the stored stage duration.
- **Total Process Time** - read-only sum of those stage minutes for the row, shown as hours/minutes (e.g. 10h 11m), not a raw minute total.
- **End Dough configuration**:
    - User selects w/c process in Chain represents “End Dough” for that product.
    - Scheduling then calculates End Dough as “Start Time + cumulative minutes up to the selected process”.

This is important because “End Dough” is not always the same point for all products. It depends on how the product is defined operationally.

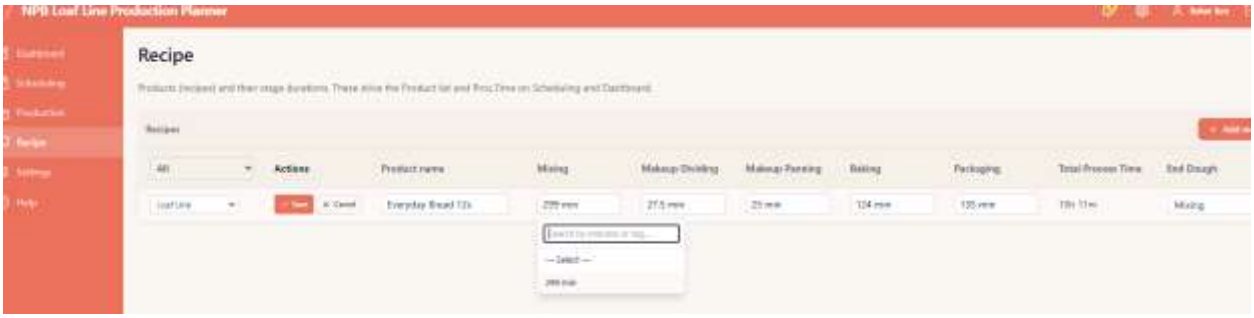

Figure 19: Edit Recipe

Entering edit mode on a row, it gets a light highlight. **Actions** become **Save** (check) & **Cancel** (X). What you can change:

- **Line (first column)** - dropdown of all lines. Changing the line clears that recipe's process durations & process profile picks in the draft (you re-pick profiles for the new line's processes).
- **Product name** - enabled text field. Save updates the recipe & if the name changed, renames the product on existing plan rows and in capacity profiles so scheduling data stays consistent.
- **Per-process cells** - when line has process profiles defined in Production, each stage is a profile picker (button showing something like 299 min). Opening it shows Search by minutes or tag... & a list of profiles labeled by total minutes for that process on that line. Picking a profile sets both stored minutes & profile id (used for stagger / pipeline logic). If a process has no profiles on that line, the cell shows N/A.
- **Total Process Time** - still derived. It updates from the draft minutes (same display format as view mode).
- **End Dough** - dropdown of that row's line processes. This maps to end Dough Process Id in data in the app's program code. it defines w/c stage boundary is used for "End Dough"-style timing relative to Start Sponge on Scheduling Page.

Saving / canceling

- **Save** writes the recipe to the store (and propagates renames as above).
- **Cancel** discards the draft and returns the row to read-only display.

Relation of Recipe Page to other Pages

- **Production Page** - defines lines, process order & profiles (minutes/tags) that the Recipe page pickers list.
- **Scheduling / Dashboard Page** - consume recipe durations, profiles & End Dough for Proc. Time, Gantt segments & stage tables.

Live View Page - is designed for day-of execution & monitoring. Instead of configuring or building the schedule, it focuses on operational visibility:

- Shows the current & upcoming batches in a way that floor users can follow.
- Highlights what should be running now, what is next & what has completed.
- Surfaces Requests & Updates relevant to execution so changes are visible w/o going back to Scheduling.
- Supports quick decision-making during production by keeping the latest plan & its status accessible.

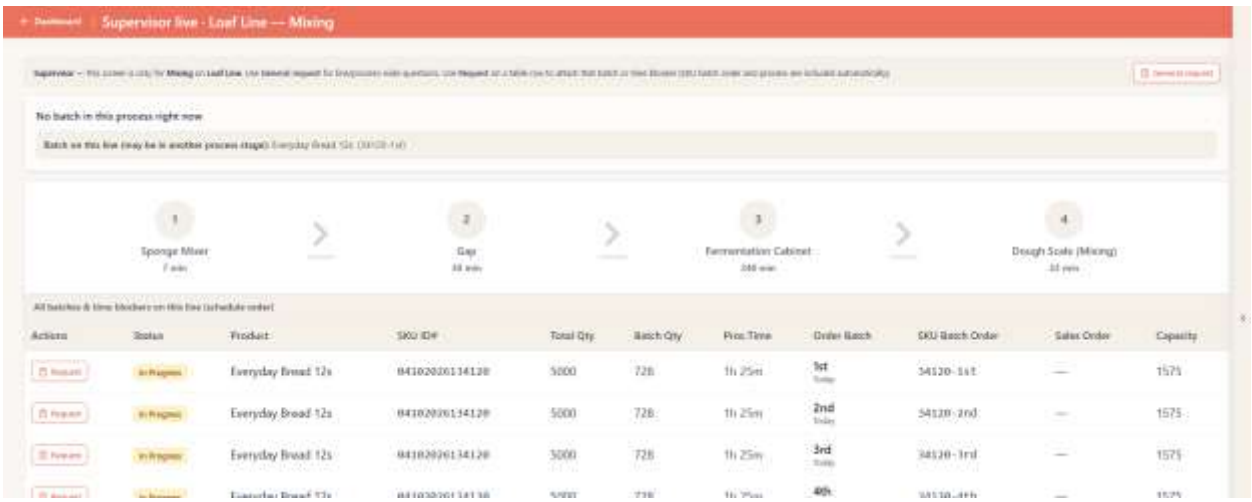

Figure 20: Live View Page (Depending on Selected Process for Live Viewing)

This is NOT the main Dashboard layout. You open it from the Dashboard Production Line Stage Table (**Live View Button** on a process tab), w/c navigates to:

/live/line/<line id>/process/<process id>

The **red header** includes **← Dashboard** to return to /dashboard. The title is:

Supervisor live · <Line name> - <Process name>

(e.g. ***Loaf Line — Mixing*** *or* ***Packaging****)*

Live View - default / "idle for this process":

Supervisor banner - explains scope in this screen as it is **only** for the **named process** on the **named line**. Found also in this banner is a **General request Button** - line/process-wide (not tied to one table row). Other version of this is **Request on a row** - ties the message to that batch or time blocker. SKU batch order & process are filled in automatically.

Current batch card (dashed border) - When no batch's clock is inside this process's time window *right now*, the card shows:

- **"No batch in this process right now"**

Below that, if the line has schedule data, a footnote line can appear:

- **"Batch on this line (may be in another process stage):"** *product (SKU batch label)* when some batch on the line is **In-Progress** but not in *this* process's window or
- **"Next on this line (by schedule start):"** ...
  when nothing is in progress on the line in same sense app uses for that message.

Figure 21: Live View Page's Supervisor Banner and Current Batch Card

So, the line can be busy, but Mixing (for example) can still show "empty" if the **In-Progress** work is counted in another stage's window.

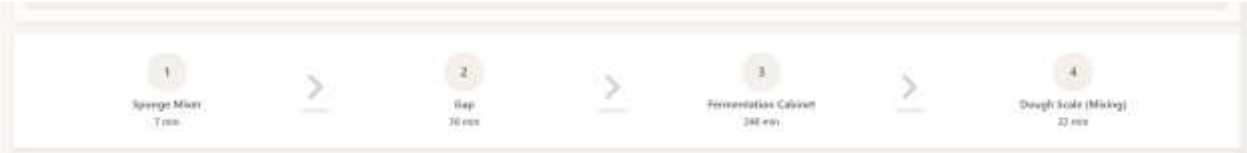

Figure 22: Live View Page's Process Stepper Flow

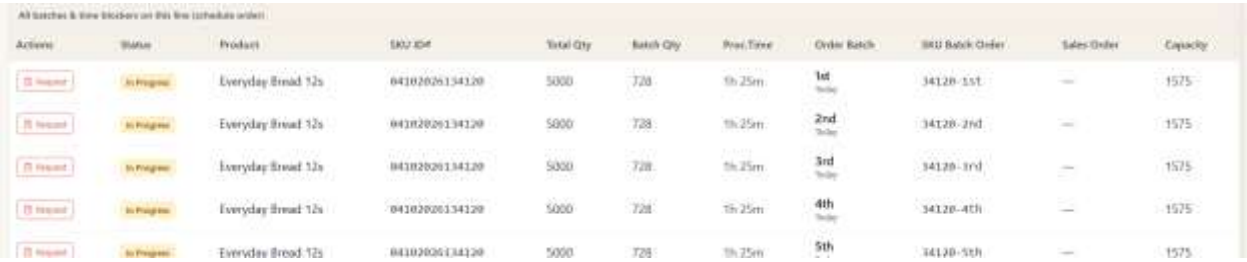
Process Stepper Flow is the Horizontal numbered steps for this process only. Sub-stages from the process profile on that line:

e.g. Sponge Mixer → Gap → Fermentation → Dough Scale

Each step shows a duration. When there is no active batch in this process, the stepper has not highlighted "current" step. The steps you see in the Stepper are based on the set **Process Profile (per Process) of the Production Line** found at **Production Page** & used by the **Product** on the **Recipe Page** meaning, the steps you see on Stepper changes depending on the **Process Chain (per Line).**



Actions	Status	Product	SKU ID#	Total Qty	Batch Qty	Proc.Time	Order Batch	SKU Batch Order	Sales Order	Capacity
		Everyday Bread 12s	04102020134120	5000	720	1h 25m	1st	34120-1st	—	1575
		Everyday Bread 12s	04102020134120	5000	720	1h 25m	2nd	34120-2nd	—	1575
		Everyday Bread 12s	04102020134120	5000	720	1h 25m	3rd	34120-3rd	—	1575
		Everyday Bread 12s	04102020134120	5000	720	1h 25m	4th	34120-4th	—	1575
		Everyday Bread 12s	04102020134120	5000	720	1h 25m	5th	34120-5th	—	1575

Figure 23: Live View Page's Table of All Batches & Time Blockers

Table Named "All batches & time blockers on this line (schedule order)"

- **Full line queue -** batches & time blockers, ordered like the schedule.
- **Columns match the app** - Actions (row Request), Status, Product, SKU ID#, Total Qty, Batch Qty, Proc. Time, Order Batch, SKU Batch Order, Sales Order, Capacity. Proc. Time Column here is for this process column context (same idea as other plan tables scoped to a stage).

If the line has no rows, you get copy pointing users to **Scheduling** to add batches.

Timing note (optional for admins) - Status and the "time remaining" math refresh on a ~10 second tick, so the countdown is not second-by-second real-time.

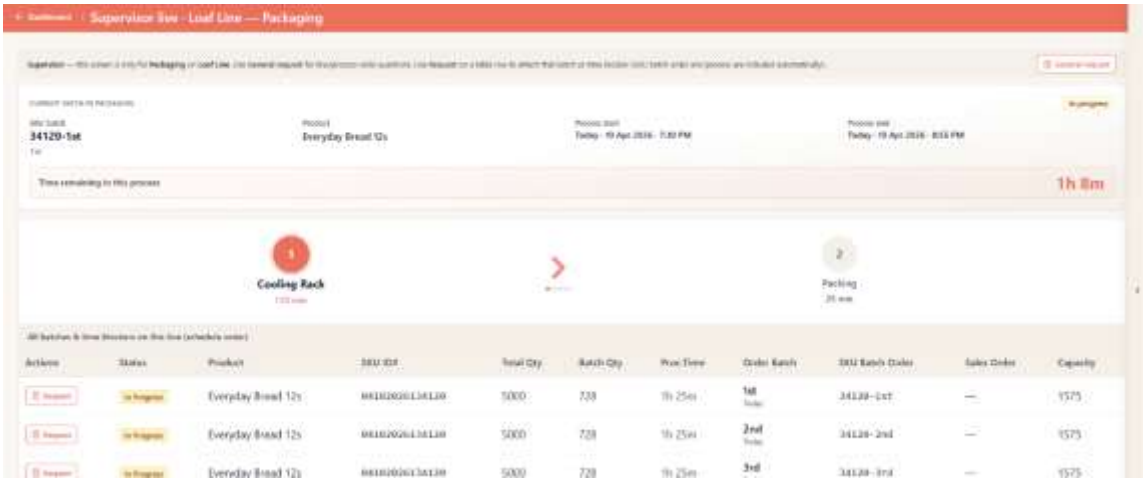


Figure 24: Live View Page's Batch Active at Packaging Live View Page

Live View - Batch Active in this process:

When the app finds a plan row **In-Progress** & now falls inside this process's start/end window for that row, the current batch card switches to the solid / gradient style:

- **Heading:** CURRENT BATCH IN <PROCESS>

  e.g. PACKAGING, w/an In-Progress pill
- **SKU batch (and Order batch subtitle when available).**
- **Product.**
- **Process start / Process end** - calendar-aware strings ("Today", date, time).
- **Time remaining in this process** - large countdown (e.g. 1h 8m).

The step in the Process Stepper Flow currently active inside this process is highlighted (e.g. red circle). Others stay neutral. Partial progress w/in a step can be reflected in the stepper, not only "step 1 vs 2."

In short, **Live View Page** is the operations-facing interface. The schedule becomes a live run plan, with updates/requests capturing real-world changes.

Pre-requisite

In this section, we will learn how to use the Demo App from Scratch as it all starts here or what the Configuration side is as described in **App Structure Figure 1: High Level View.** This part is essential because you cannot do Scheduling of Batches for Production, of Time blockers nor see Live View progress of the batch unless you have at least one profile of each on these Pages namely the **Production Page and Recipe Page.** In this section we will discuss step-by-step how to use the Demo App.

Step 1: Go to Production Page & create a Line (e.g. Loaf Line as shown in Figure 25) by pressing the "Add Line" button when the field has naming value of the Production Line to be added. When creating a Line, its naming value depends on User like if the User is creating a Production Line for Loaf, User can say Loaf Line (or Bun Line, etc.) to the field and press "Add Line" button.

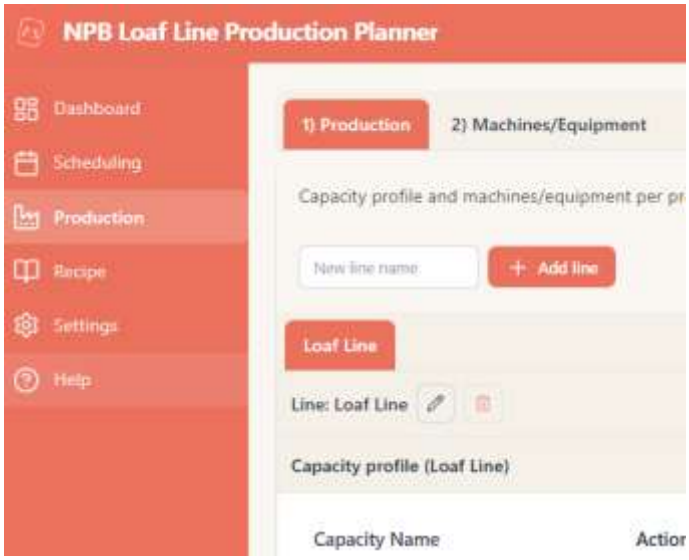

Figure 25: Production Page, Add Production Line

Step 2: Go to Recipe Page & create a Product by clicking "Add Recipe" button in the top right-side corner. Then a dialog will appear for you to choose Production Line and input the name value of the Product you wanted to create (see Figure 26).

Upon filling out the name value of the Product field, press “Add Button” then it will reflect just like on Figure 27.

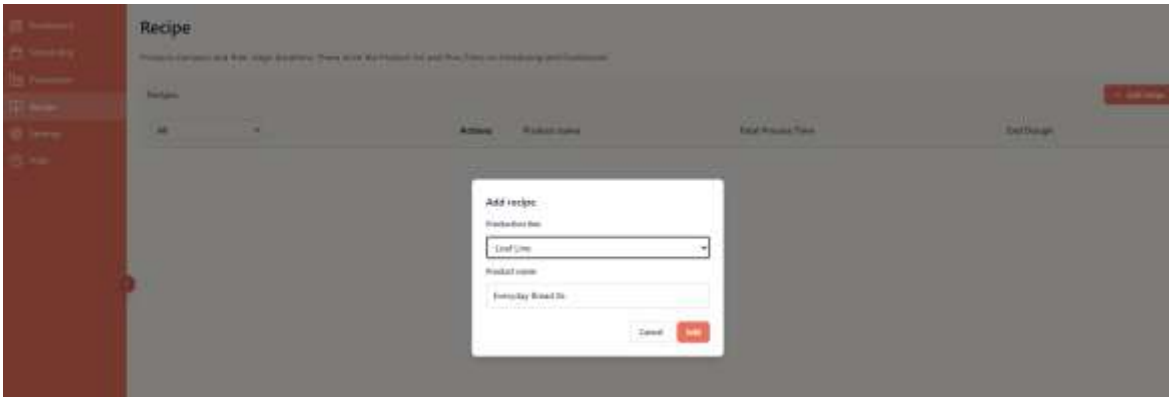

Figure 26: Recipe Page, Add Product Process Dialog

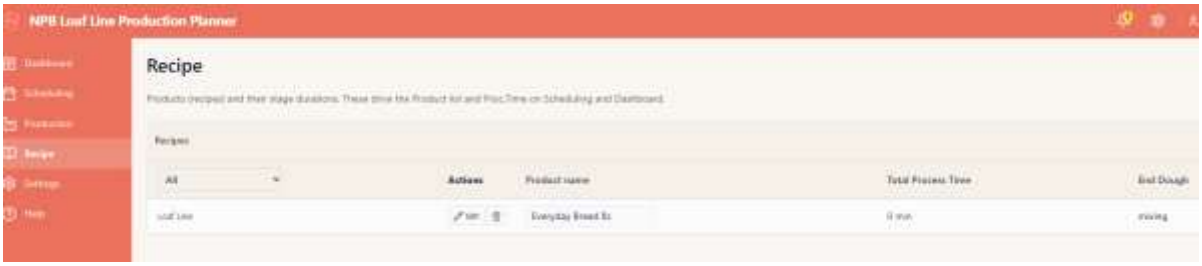

Figure 27: Recipe Page, Added New Product, Table Not Empty

Step 3: Go back to Production Page & create a Capacity Profile by clicking “Add” button in the right-side corner under table of Capacity Profile Card. Then a dialog will appear for you to choose Product & inputs of the Product like Capacity, Yield, Dough, etc. you wanted to create (see Figure 28). Upon filling out inputs of Capacity Profile field, press “Add” then it will reflect just like on Figure 29.

Figure 28: Production Page, Add Capacity Profile Dialog

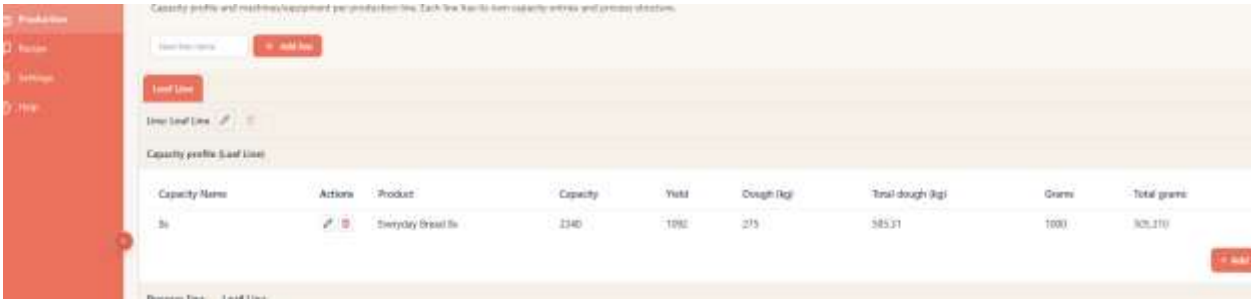

Figure 29: Production Page, Added New Capacity Profile, Table Not Empty

Step 4: Still inside the Production Page & create a Process Chain Line (per Process) by clicking "Confirm" button below the lowest part of the Production Page. Input name of Process like Mixing, Makeup, Baking, etc. you wanted to create (see Figure 30). Upon filling out the input of Add Process field, press "Confirm" then it will reflect just like on Figure 31 as tab.

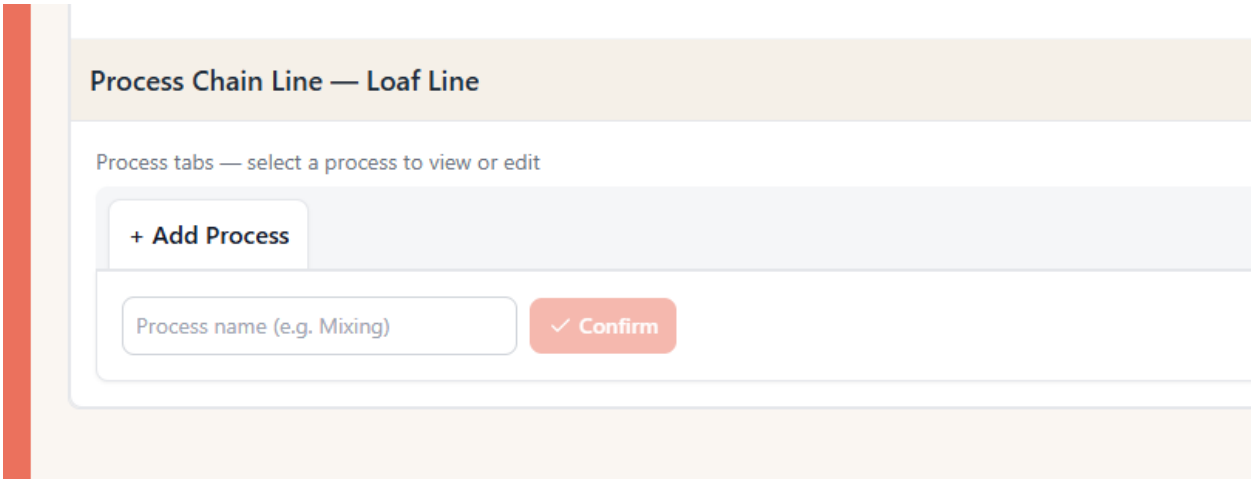

Figure 30: Production Page, Adding New Process Chain Line (per Process)

Figure 31: Production Page, Added New Process Chain Line (per Process) named Mixing

Step 6: Still inside the Production Page & create other Process Chain Line (per Process) just like on step 5 until you completed the Production Line's Process Chain Line (per Process) profile e.g. whole process of Loaf Line as seen in Figure 32.

Figure 32: Production Page, Added Other New Process Chain Line (per Process)

Step 7: Still inside the Production Page & create a Process Profile inside each of the Processes Tab created from Process Chain Line (per Process) step 5-6, by clicking "Add name_of_process profile" button in the right-side corner of the Tab. Then, Mixing Profile will appear having 2 sections of it namely Machines/Equipment card and Process times card as seen in Figure 33. The **goal of this step is to create Process Timing Profiles for each Process of the Process Chain Line (per Process) that the Product in the Recipe Page** can refer to in order to create a Production Schedule based of profile created Product in the **Scheduling Page.**

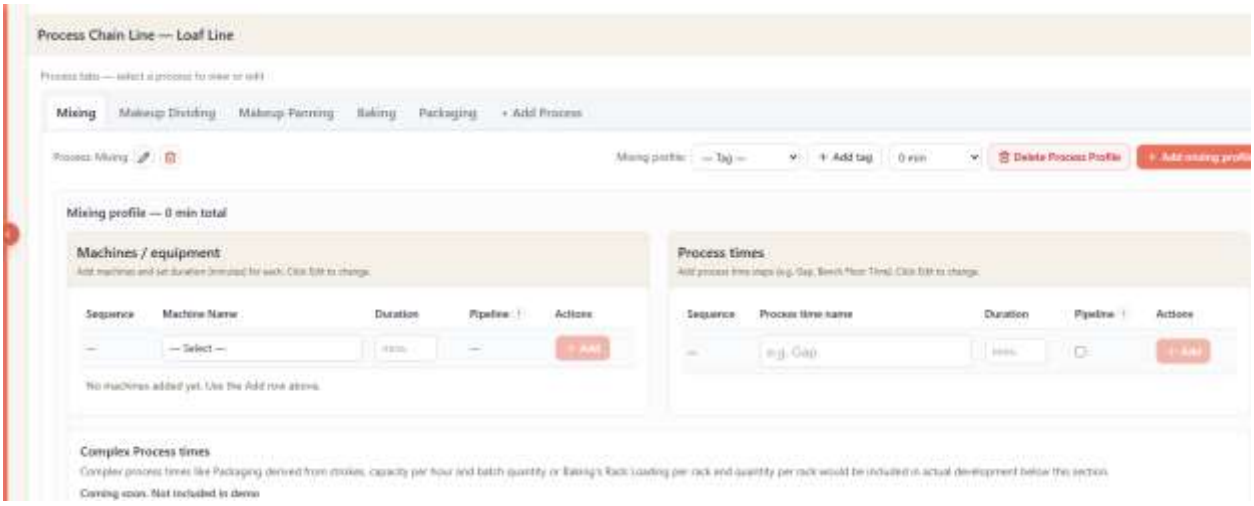

Figure 33: Production Page, Added New Process Profile of Mixing

Step 8: Still inside the Production Page & fill out Mixing Profile's Machine/Equipment card section w/the Process' (Selected Tab) Timing Variables. Upon clicking Machine Name field w/c is a dropdown, it will show list of Machines/Equipment as seen in Figure 34. This list is based on the populated Machines/Equipment Tab section in the topmost of Production Page beside the Production Tab as seen in Figure 35. In this tab, you can manage the Machines/Equipment Listing.

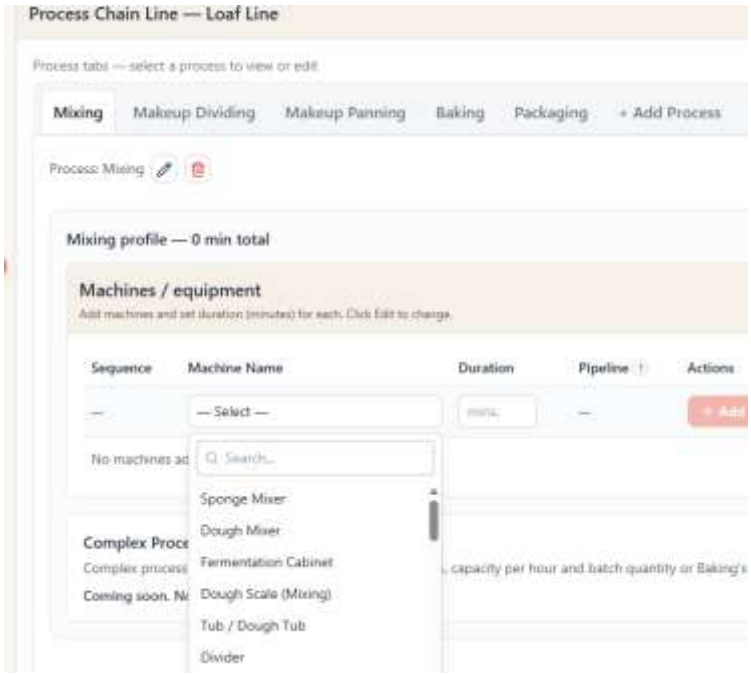

Figure 34: Machine/Equipment Section of Selected Process, List of Machines Dropdown

Figure 35: Machine/Equipment Tab Beside Production Tab that populates Machine Name

To create Timing Variables inside Machine/Equipment Section of Selected Process Tab from Process Chain Line (per Process), see Figure 36 how fields are filled. Upon

adding Timing Variables inside the Machine/Equipment section of the Per Process Profile, you see that it's a table and its Columns are:

- **Sequence** – this column is important for this decides the sequence of Process Steps inside the Per Process Profile. The Sequence column's value are numerical & follows ascending logic, meaning, User doesn't just create Timing Variables but considers its flow inside Per Process Profile, in this case, Figure 36 is Mixing Process Profile. **This matters for Live View Page**.
- **Machine Name** – the values under this are based on the steps inside the Process where in case of Figure 36, The Mixing Process consist of having Sponge Mixing done via Sponge Mixer Machine, Fermentation Stage where Fermentation Cabinet is used & Mixing Time using Dough Scale for Mixing.

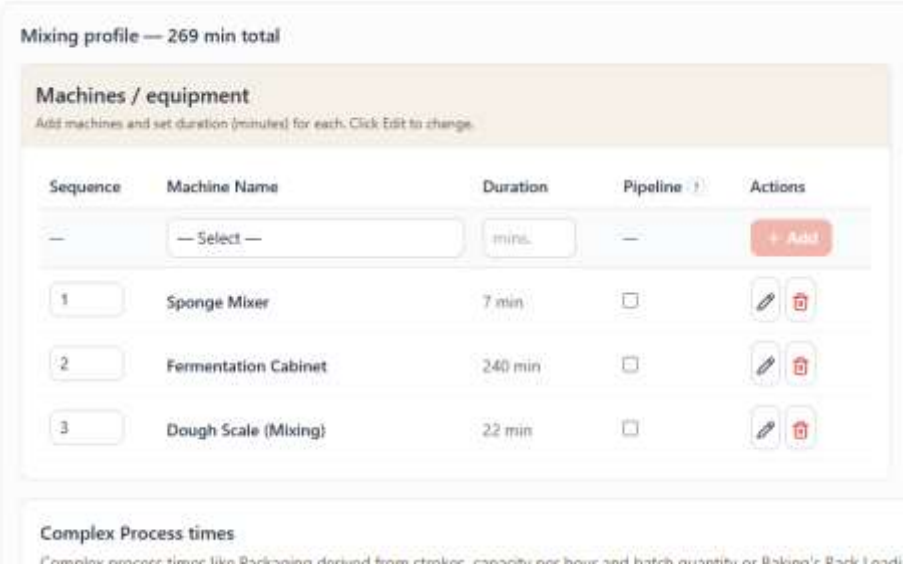

Figure 36: Machine/Equipment section of Process Profile filled

- **Duration** – the values under this are based on the steps inside the Process where in case of Figure 36, The Mixing Process consist of having Sponge Mixing done having 7 minutes process time, Fermentation Stage where process time is 240 minutes & Mixing Time around 22 minutes. This makes the current Total Timing of Per Process Profile (e.g. Mixing Profile Process)

total of 267 minutes before proceeding on next Per Process Profile (e.g. Makeup Dividing).

Step 9: Still inside the Production Page & fill out Mixing Profile's Process times card section w/the Process' (Selected Tab) Timing Variables same on Step 8 but not Machines but Timing Variables that are not Machine/Equipment Influenced. In the Process time name, it's not a drop down but a text field where you have to name the process time depending on the User as seen in Figure 37 (e.g. Mixing Process has this "Gap" w/c is a waiting time). Timing Variables added in this section also is related to the Sequences of the Machine/Equipment section, meaning, User can declare a Timing Variable on this side to be Sequence #2 & that makes value 2 unable to be used again even on Machine/Equipment section (In our example Figure 36, 37, Mixing Profile's step sequence is Sponge Mixing then Gap then Fermentation Stage then Mixing time meaning we have to modify the Sequence # value of both section since its Sponge Mixing then Fermentation Stage then Mixing time then Gap w/c is wrong, See Figure 38).

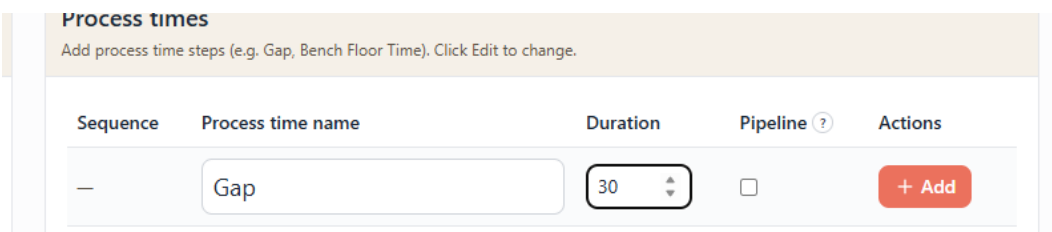

Figure 37: Process times section of Process Profile filled

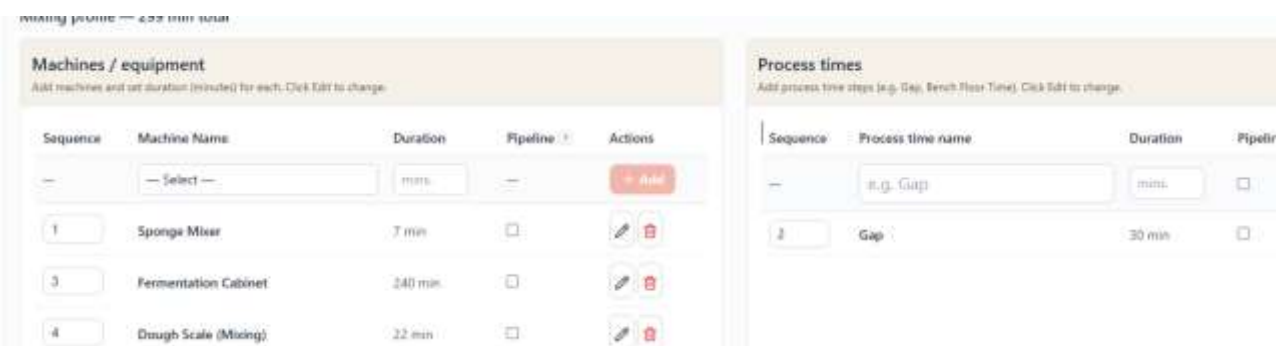

Figure 38: Machine/Equipment & Process times section Sequence Value Re-Arranged

In order to fully finish creating Per Process Profile Timing Variables (both Machine/Equipment and Process times section have same Columns, there are other Columns that have yet to be discussed on Step 8:

- **Pipeline** – this column contains checkbox(es) and it has tooltip (question mark icon) beside the Column Name to. This is important for this allows other Schedule Records to proceed running after this checked Pipeline Timing Variable is done, resulting in an overlapping run of Schedule Records w/o waiting for current Schedule Records to finish. Figure 39 shows an example that Gap Timing Variable under Process times would have its Pipeline Checkbox check because based on the Mixing Process, the Gap step is the start of accepting another batch to perform after it is done. It cascades created Schedules as seen in Figure 40 in Dashboard Page.
- **Actions** – Edit & Delete button to modify & remove Timing Variable added.

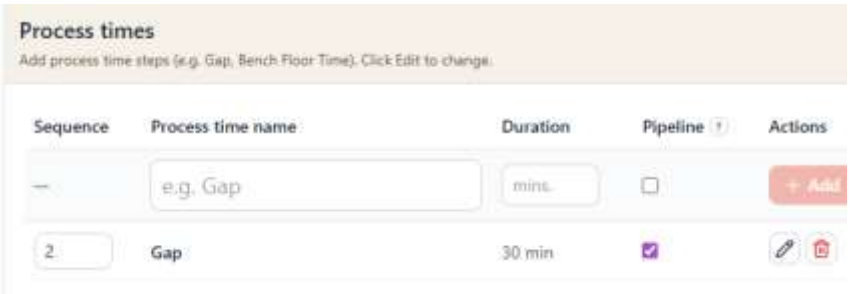

Figure 39: Machine/Equipment & Process times section Sequence Value Re-Arranged

Figure 40: Dashboard Page, Production Gantt Chart (Schedule Records Cascading)

Step 10: Still inside the Production Page & repeat Step 8 & 9 on Per Process Profile Tabs until all of these have Timing Variables that completes the Production Line's Process Chain Line (Per Process) depending on User's input and Product.

Step 11: Go to Recipe Page & edit the Product that now contains Process Chain Line (Per Process) e.g. in our example are valued 0 since the Product was created first w/o finishing the Process Chain Line (Per Process) as seen in Figure 41. Edit the Product e.g. Everyday Bread 8s Process Chain Line (Per Process) Time values until all have the set Timing based of the Process Profile of each Processes as seen in Figure 42. The Total Process Time Column is automatically computed summing up all the Timings of the Process Chain Line (Per Process).

Figure 41: Recipe Page, Everyday Bread 8s now having Processes that needs Editing

Figure 42: Recipe Page, Everyday Bread 8s Processes have all Edited

Figure 43: Recipe Page, Total Process Time & End Dough Columns

Doing all these steps ends the **Pre-Requisite** & may be done again for new Profiles & Products or changes as these are supposed to be configs to be set up once but updateable.

Scheduling

In this section, we will learn how to use the Demo App in terms of Scheduling features now that Pre-Requisite were supposed to be done. Because unable to do Pre-Requisite at least even one (1) entire Production Profile & one (1) Recipe/Product would make the Scheduling not work & throw error reminders to User commanding it to do the Pre-Requisite. Production Profile & Recipe/Product contains all the timing parameters needed for the Scheduling is all about creating schedule being automatically handled/computed via timing variables. In this section, we will learn how to create Schedule of Production, the auto-batch generation of Schedule of Production, creation of different types of Schedule w/the use of Time blockers, insertion of conflicting Schedule and its Schedule Reflow feature on all affected Schedules, Re-ordering/Swapping of Schedules and deletion of Schedule.

Schedule Creation of Product:

Step 1a: Go to Scheduling Page & click "Add Schedule" button and a dialog will appear as seen in Figure 44. You will see three (3) tabs namely Quantity, Sales Order and By Others. In the Quantity Tab, select a Product to do a schedule batch(es) w/. If want to generate the schedule already, just fill out the Total Quantity and click "Add Batch". This will generate you an SKU having schedule batch(es) but w/o details e.g. Sales Order, SO-CO, Samples, Exchange for Loss, etc. as

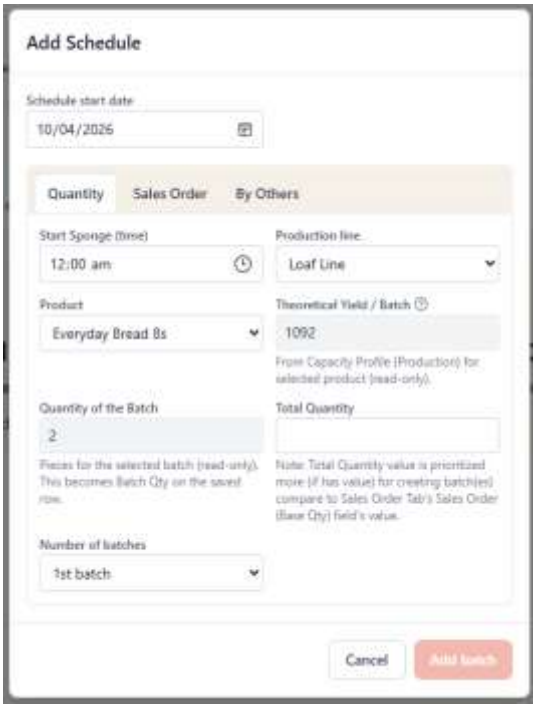

Figure 44: Add Schedule, Quantity Tab

seen in Figure 45. If you wanted to generate a schedule of SKU having details, you have to go to Sales Order Tab and there you fill out everything you needed and if the Total Quantity in the Quantity Tab is “=0”, the app will use the Sales Order (base qty) field in the Sales Order Tab for generating schedule batch(es) but if it has, it will use the Total Quantity in the Quantity Tab instead and the Sales Order (base qty) value in its field will still be recorded as its SKU’s detail as seen in Figure 46.

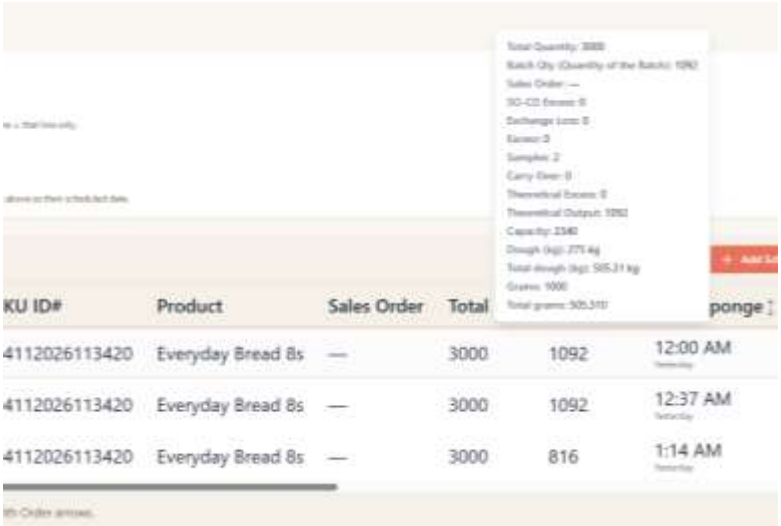

Figure 45: Scheduled Batch(es) using Quantity Tab fields only, No SKU details

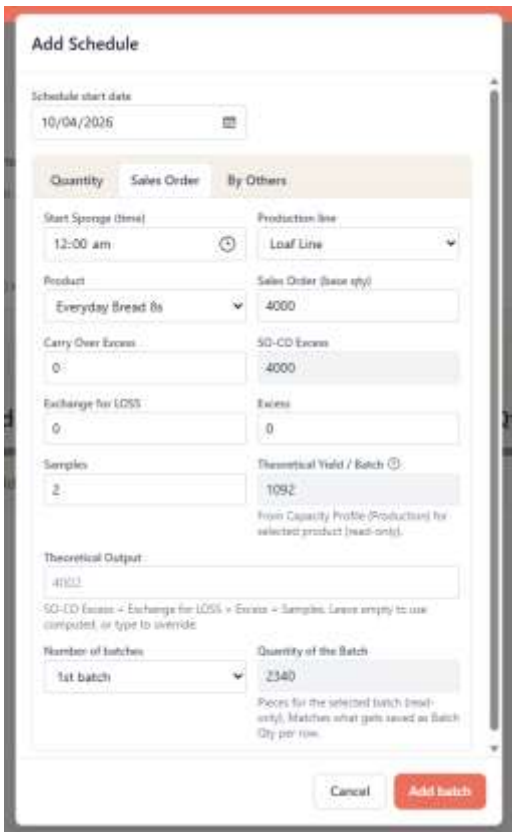

Figure 46: Sales Order Tab fields filled to generate Schedule’s SKU w/ details

Figure 47: Scheduled Batch(es) using Sales Order Tab fields only, w/ SKU details

Step 1b: Go to Scheduling Page & just like Step 1a, click the "Add Schedule" button & the Add Schedule dialog having Quantity Tab, Sales Order Tab & By Others Tab will be shown. This step is about adding a schedule that w/in the existing schedule has already generated. This is a "time conflicting scheduling" wherein App Demo detects this & prompts User that it is a schedule of conflict as seen in Figure 48 & 49. Still, User can proceed such add of schedule, forcing App Demo to do the scheduling feature called "Reflow" or timing schedules of the existing (those that are affected) will be adjusted automatically to pave way to User's schedule addition/insertion that causes time conflict as seen in Figure 50.

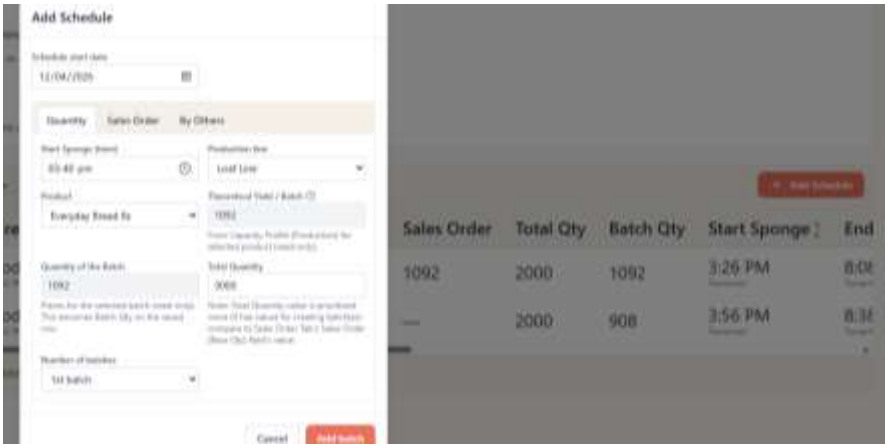

Figure 48: Add Schedule in between 3:26pm & 3:56pm at 3:30pm same day

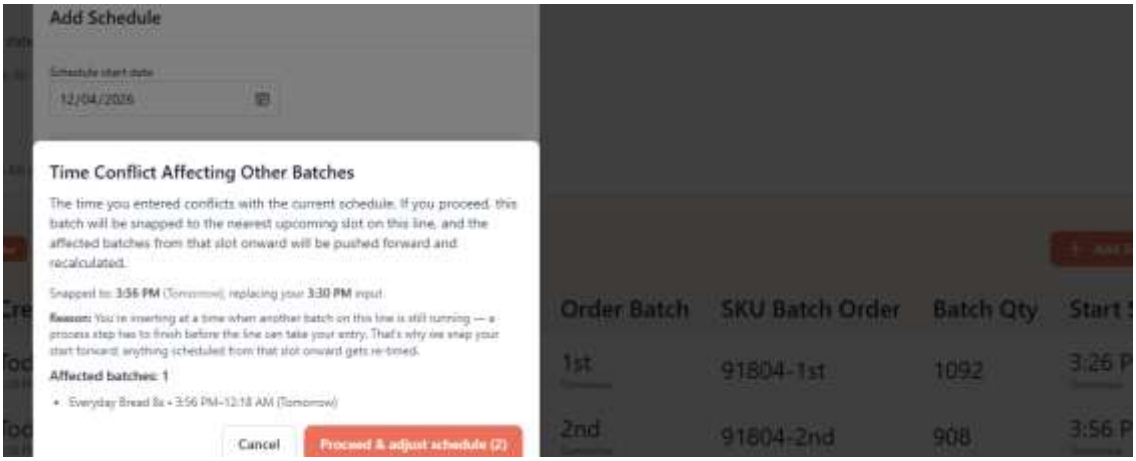

Figure 49: Time Conflicting Schedule Prompt for Figure 48 example

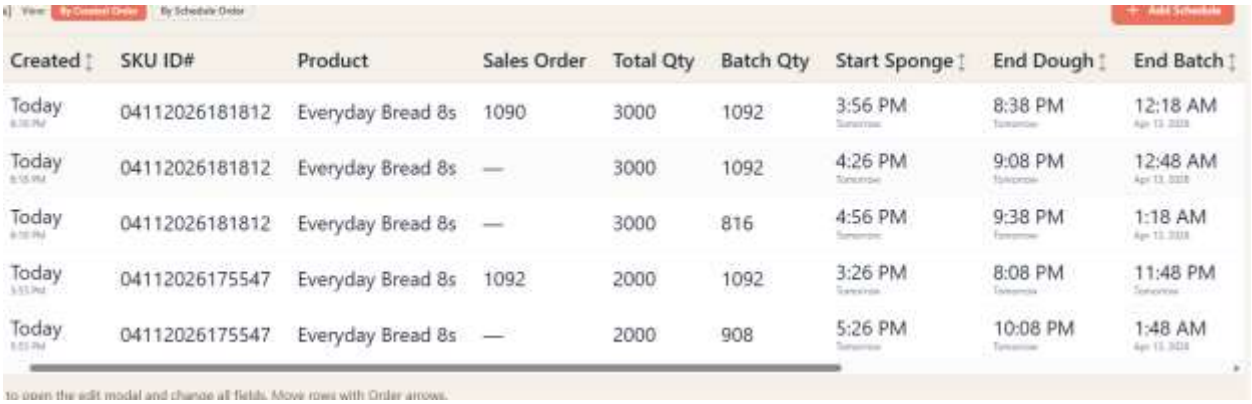

Created	SKU ID#	Product	Sales Order	Total Qty	Batch Qty	Start Sponge	End Dough	End Batch
Today	04112026181812	Everyday Bread 8s	1090	3000	1092	3:56 PM	8:38 PM	12:18 AM
Today	04112026181812	Everyday Bread 8s	—	3000	1092	4:26 PM	9:08 PM	12:48 AM
Today	04112026181812	Everyday Bread 8s	—	3000	816	4:56 PM	9:38 PM	1:18 AM
Today	04112026175547	Everyday Bread 8s	1092	2000	1092	3:26 PM	8:08 PM	11:48 PM
Today	04112026175547	Everyday Bread 8s	—	2000	908	5:26 PM	10:08 PM	1:48 AM

Figure 50: Continuing Time Conflicting Schedule Prompt from Figure 49 example, Reflow

Schedule Creation of Time Blocker:

Step 1: Go to Scheduling Page & click "Add Schedule" button and the Scheduling dialog shows & click the "By Others" Tab as seen in Figure 51. This part of the Scheduling dialog is for creating a Time blocker schedule or actually, just any Schedule you wish for multiple purposes like scheduling Production Break, Manpower Breaktime, Scheduled Cleaning, Sudden Maintenance or Machine Troubleshooting Schedule, any schedule as the schedule to be generated will have its identification based of the Description field value. The Time blocker schedule Start Time will show on the Scheduling Table's Start Sponge Column & the Time blocker schedule End Time will show under the End Batch Column. **This works the same too if you are to use "Time conflicting scheduling" like on Step 1b of Schedule Creation of Product applying Reflow feature**.

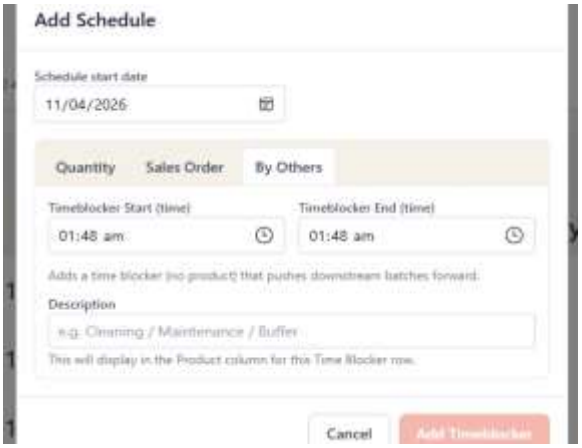

Figure 51: Add Schedule, Time blocker

SKU ID#	Product	Order Batch	SKU Batch Order	Batch Qty	Start Sponge	End Dough	End Batch	Pro
04112026175547	Everyday Bread 8s	1st	75547-1st	1092	4:00 PM	8:42 PM	12:22 AM	10
04112026181812	Everyday Bread 8s	2nd	81812-1st	1092	4:30 PM	9:12 PM	12:52 AM	10
04112026181812	Everyday Bread 8s	3rd	81812-2nd	1092	5:00 PM	9:42 PM	1:22 AM	10
—	Cleaning Break	4th	—	—	5:30 PM	—	5:40 PM	10
04112026181812	Everyday Bread 8s	5th	81812-3rd	816	5:40 PM	10:22 PM	2:02 AM	10
04112026175547	Everyday Bread 8s	6th	75547-2nd	908	6:10 PM	10:52 PM	2:32 AM	10

Figure 50: Add Schedule Time blocker applying Reflow also

Scheduling Table View Sorting Mode:

The User may experience viewing confusion when schedules created where not done/created in sequence but in time schedules they are. By default, the table is sorting as "Descending by Latest Created Schedule". You can sort this by actual scheduling upon hitting the "By Schedule Order" button above the table & it will even re-arrange the table's Column sequence seeing Order Batch Column & SKU Batch Order & because of this you will see you will see properly the sequence of the batches as seen in Figure 51. **You can see also among the Columns of the table that they do have a sorting button after their Column Names namely Created, Start Sponge, End Dough & End Batch** for you to do descending or ascending viewing depending on each Column.

Order	Actions	Line	Created	SKU ID#	Product	Order Batch	SKU Batch Order	Batch Qty	Start Sp
		Loaf Line	Today	04112026191804	Everyday Bread 8s	1st	91804-1st	1092	3:26 PM
		Loaf Line	Today	04112026200727	Raisin Bread 8s	2nd	00727-1st	1172	3:56 PM
		Loaf Line	Today	04112026200727	Raisin Bread 8s	3rd	00727-2nd	1172	4:21 PM
		Loaf Line	Today	04112026200727	Raisin Bread 8s	4th	00727-3rd	656	4:46 PM
		Loaf Line	Today	04112026191804	Everyday Bread 8s	5th	91804-2nd	908	5:16 PM
		Time Blocker	Today	—	Machine Cleaning	1st	—	—	5:00 PM

Figure 51: Scheduling Table sorted via "By Schedule Order" button above

Dashboard

In this section, we will learn how to use the Demo App's Dashboard Page now that you have supposedly done doing Pre-Requisite and Scheduling Section. This is because the Dashboard Page would be empty w/o the Scheduling, so in case you have yet to learn how to Schedule and prepare configurations for your Schedules, go to Pre-Requisite Section and Scheduling Section first.

Dashboard Page is mostly for monitoring and in the current Demo App, there would only be limited controls to interact w/. Dashboard Page is field w/ summaries, charts, graphs, computations and table of schedules created based of selected Production Line & are detailed-sorted based of the Production Line's Process Chain Line (Per Process). In this Demo App, the controls the user can interact w/ would be the Notification bell where the Request from Supervisor in the Process Line feature can be seen & the Live View button under the Production Line Schedule Table, right side. Other buttons and other features of Dashboard are not included in the Demo App but in actual development, these would be interactable e.g. Exports/Printings, Reportings, Histories, etc. to be working & other features not seen in the Demo App would be included also.

Figure 52: Production Line Schedule Table, Live View button bottom-right side

Live View Page Transition:

Step 1: Go to Dashboard Page & Click the "Live View" button in the bottom right side of the page w/c is under the Production Line Schedule Table & it will

redirect you to the Live View Page. The Live View Page redirection depends on what current Tab in the Production Line Schedule Table is currently selected. In Figure 52, currently, the Mixing Tab of the Production Line Profile Loaf Line is selected thus, clicking “Live View” button leads you to Live View Page for Mixing Process Line.

Notification Request & Approval:

Step 1: Go to Dashboard Page & Click the “Notification Bell” icon in the top right side of the page & it will show list of Request Notifications (see Figure 54) from supposed Supervisors having access on the Live View Page (Per Process), though in actual development, there would be various notifications like finished schedule, update on schedule, etc. That Notification Bell would have an indicator on top of it, yellow circle w/how many notifications are not handled see Figure 53. The list in the Notification Bell upon click are clickable too as seen in Figure 54 & upon clicking the notification, you are to approve or reject it (for the Demo App, it will be just this but in actual development, it will be more than this approve/reject feature). Clicking the notification opens the Request dialog as seen in Figure 55.

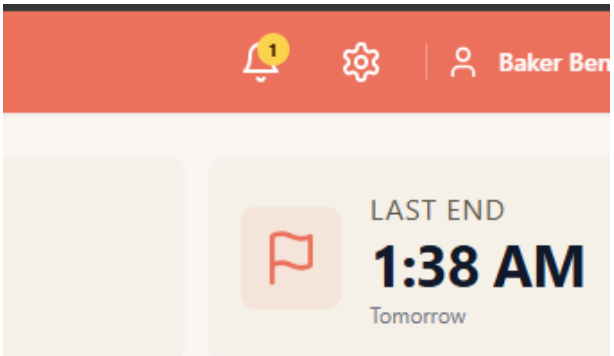

Figure 53: Notification Bell w/ Content

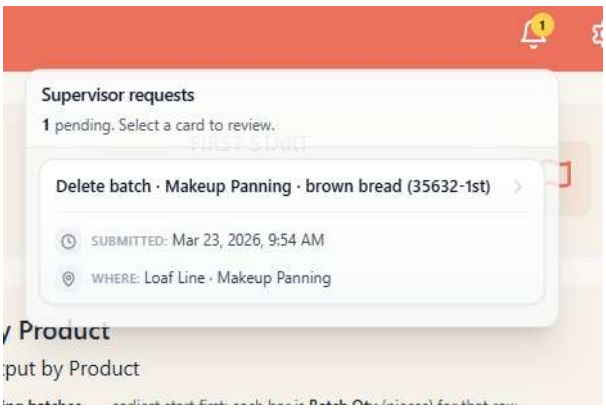

Figure 54: Notification inside Notif Bell

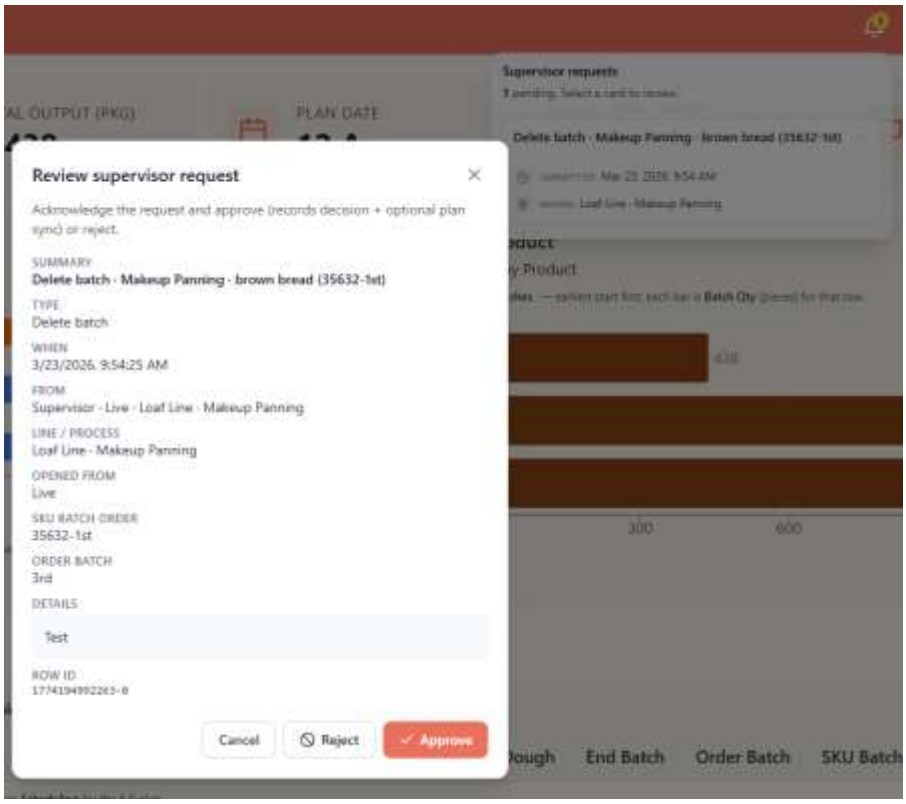

Figure 55: Production Line Schedule Table, Live View button bottom-right side

Step 2: Upon showing of Request Dialog, it's up for the User to click reject/approve or cancel to just deal w/ it later. Upon clicking approve, in the Demo App, the User is the one to do the request for the Supervisor but in actual, this would be automated or semi-automated. Since the Demo App is limited just for Proof-of-Concept (PoC) purposes only, features like Editing/Updating Schedules are not yet implemented nor other automations for such Supervisor Request. But this feature showcases the idea that the Live View Page for Supervisors depending on the Process Line can interact w/one another.

Live View

In this section, we will learn how to use the Demo App's Live View Page now that you have supposedly done doing Pre-Requisite & Scheduling Section & got here from Dashboard Page's Live View Button under the Process Tab of Production Line Schedule Table. This is won't be visible or accessible supposedly by the User if the Dashboard Page would be empty w/o the Scheduling, so in case you have yet to learn how to Schedule & prepare configurations for your Schedules, go to Pre-Requisite Section and Scheduling Section first so that Dashboard Page's Production Line Schedule Table would have Schedule Records you can go Live View w/.

Just like Dashboard Page, this page is made mostly for monitoring purposes but mostly for Supervisor's sake that uses supposedly a tablet in the Process Line e.g. Mixing Process & manages the execution of that Process. Live View Page content differs depending on the Process so if Production Line e.g. Loaf Line has 5 Processes namely, Mixing, Makeup Dividing, Makeup Panning, Baking & Packaging, we would have 5 distinct Live View Pages for each of these Processes & their content differences would be the steps inside the Process & its progress. Since this is an App Demo also, like Dashboard Page, it will have limited interactive controls like for Supervisor Request for the Process Line only but in actual development, further feature controls would be implemented. There are two (2) kinds of Supervisor Request. One is General Request w/c is accessed via button in the top right corner of Live View Page & Second is a Request per Schedule.

Supervisor Request:

Step 1a: Upon clicking General Request button, it will show a dialog containing a huge text field that the Supervisor can use to chat in details the Request regarding Process Line he is supervising as seen in Figure 56. Sending the request will add that request in the My Request list found in the right-hand side of the Live View Page, having a chevron or arrow icon

button on it where it is collapsible as seen in Figure 57. Here you can see the status of your request if it has been accepted or rejected.

Figure 56: General Request Dialog

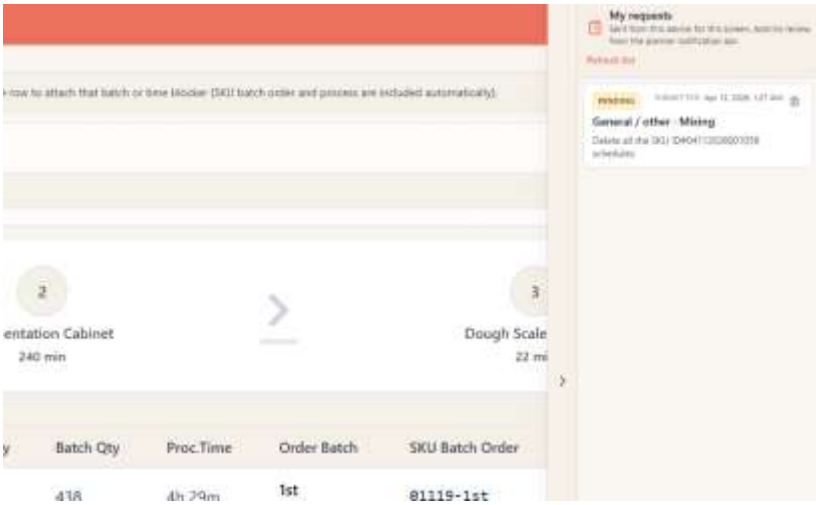

Figure 57: Request List for both General Request & Request per Schedule lies here

Step 1b: Upon clicking Request button on a certain Schedule Record/Row under the Actions Column of Schedule Table, it will show a dialog containing a dropdown for type of Request for the selected Schedule row & a huge text field that the Supervisor can use to chat in details the Request regarding Process Line he is supervising as seen in Figure 58. Sending the request will add that request in the My Request list found in the right-hand side of the Live View Page, having a chevron or arrow icon

button on it where it is collapsible as seen in Figure 57. Here you can see the status of your request if it has been accepted or rejected.

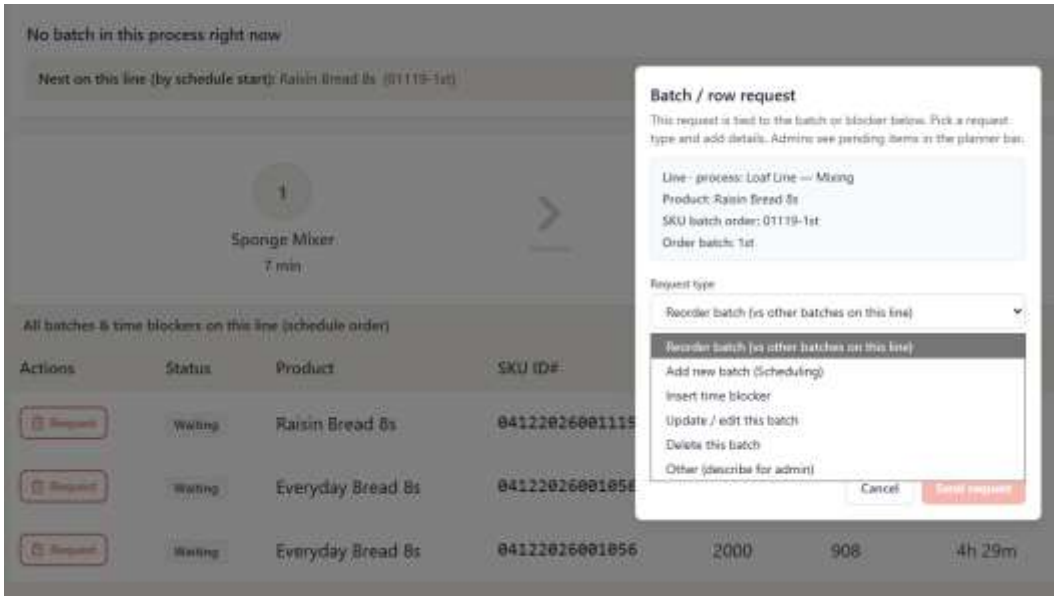

Figure 58: Request on Schedule Record Dialog

TLDR

This would be the section (Too Long Didn't Read) most everyone would look at if the previous documentation is yet tedious to be read unless seeking further details about how the Demo App behaves, works & its foundation. Here you will learn straight forward, faster how to use the Demo App w/o further ado.

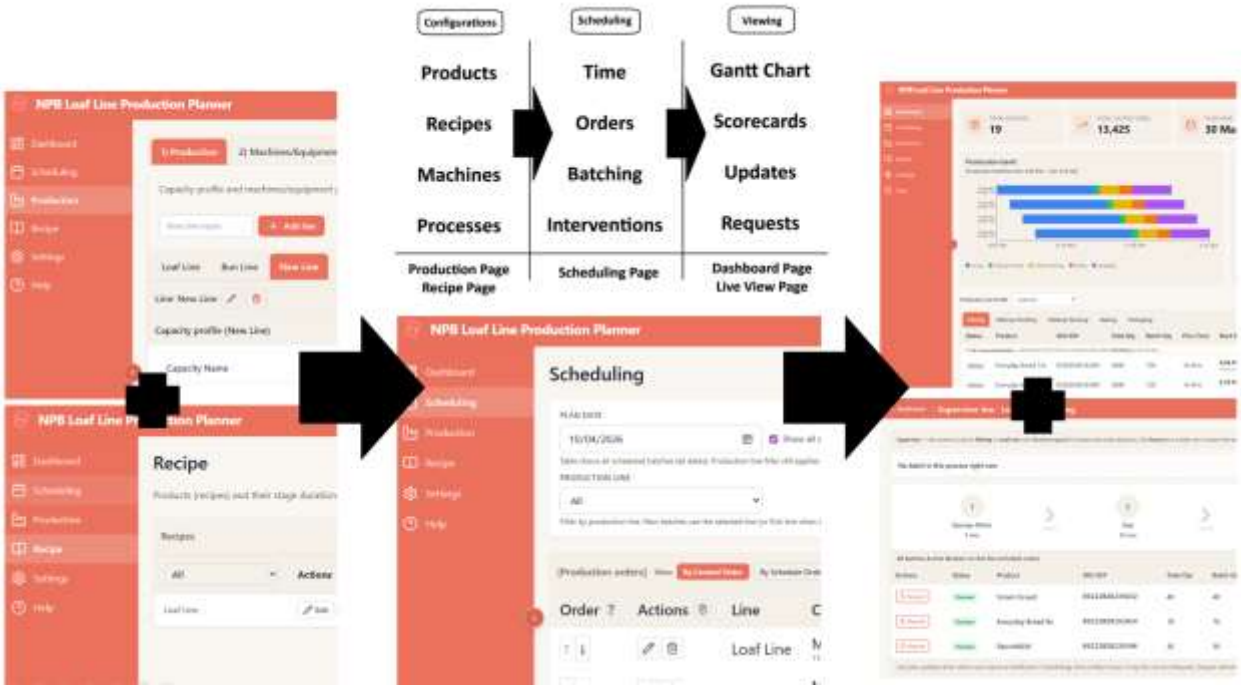

Figure 59: To use "Production-Recipe then Scheduling then Dashboard-Live View Pages"

Detailed Step Below:

Step 1: Go to Production Page & create a Line (e.g. Loaf Line as shown in Figure 60) by pressing the "Add Line" button when the field has naming value of the Production Line to be added. When creating a Line, its naming value depends on User like if the User is creating a Production Line for Loaf, User can say Loaf Line (or Bun Line, etc.) to the field and press "Add Line" button.

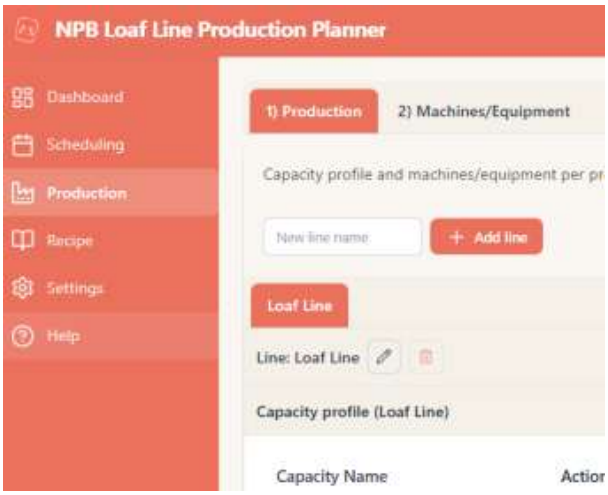

Figure 60: Production Page, Add Production Line

Step 2: Go to Recipe Page & create a Product by clicking "Add Recipe" button in the top right-side corner. Then a dialog will appear for you to choose Production Line and input the name value of the Product you wanted to create (see Figure 61). Upon filling out the name value of the Product field, press "Add Button" then it will reflect just like on Figure 62.

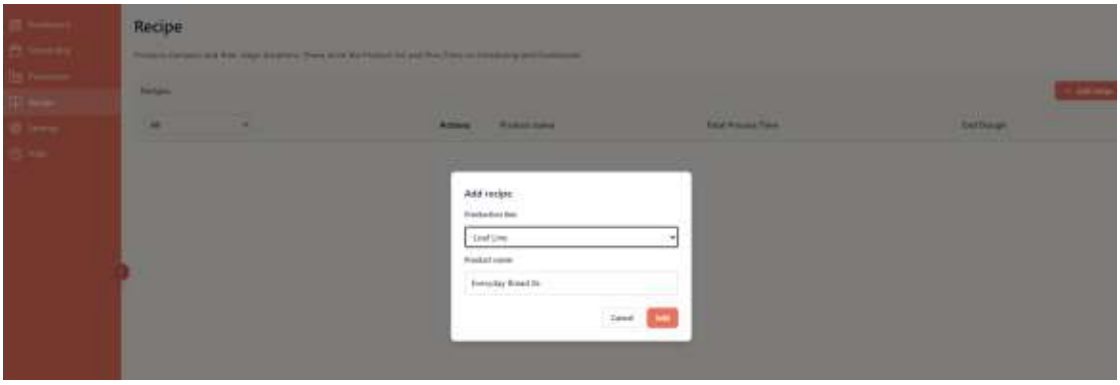

Figure 61: Recipe Page, Add Product Process Dialog

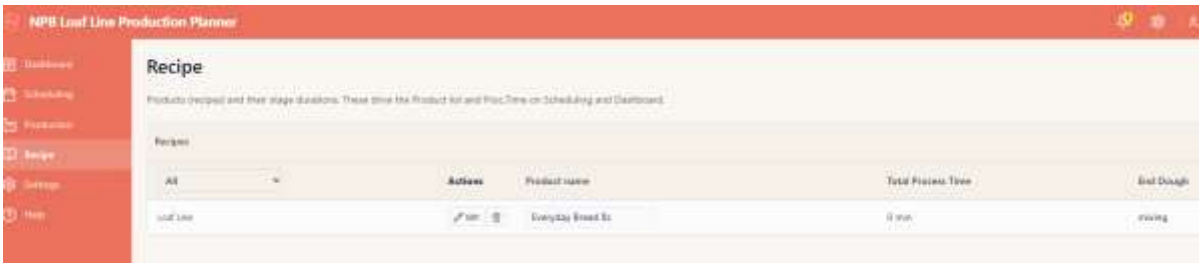

Figure 62: Recipe Page, Added New Product, Table Not Empty

Step 3: Go back to Production Page & create a Capacity Profile by clicking "Add" button in the right-side corner under table of Capacity Profile Card. Then a dialog will appear for you to choose Product & inputs of the Product like Capacity, Yield, Dough, etc. you wanted to create (see Figure 63). Upon filling out inputs of Capacity Profile field, press "Add" then it will reflect just like on Figure 64.

Figure 63: Production Page, Add Capacity Profile Dialog

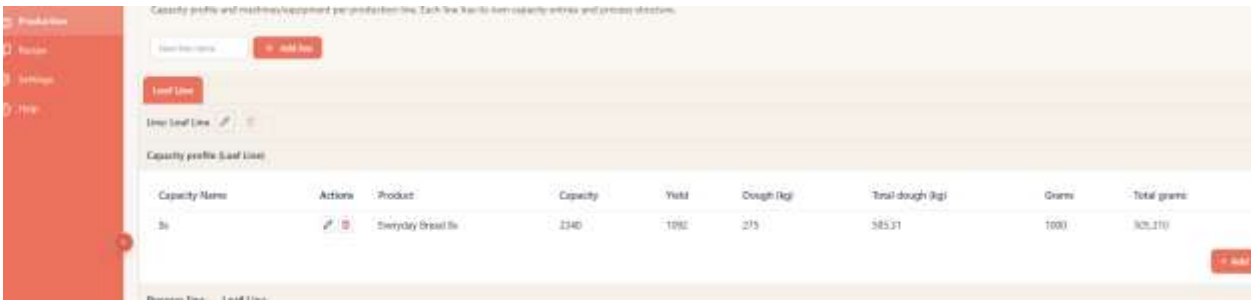

Figure 64: Production Page, Added New Capacity Profile, Table Not Empty

Step 4: Still inside the Production Page & create a Process Chain Line (per Process) by clicking "Confirm" button below the lowest part of the Production Page. Input name of Process like Mixing, Makeup, Baking, etc. you wanted to create (see Figure 65). Upon filling out the input of Add Process field, press "Confirm" then it will reflect just like on Figure 66 as tab.

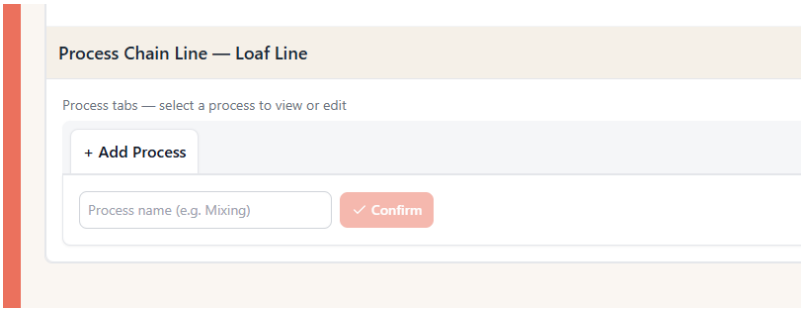

Figure 65: Production Page, Adding New Process Chain Line (per Process)

Figure 66: Production Page, Added New Process Chain Line (per Process) named Mixing

Step 6: Still inside the Production Page & create other Process Chain Line (per Process) just like on step 5 until you completed the Production Line's Process Chain Line (per Process) profile e.g. whole process of Loaf Line as seen in Figure 67.

Figure 67: Production Page, Added Other New Process Chain Line (per Process)

Step 7: Still inside the Production Page & create a Process Profile inside each of the Processes Tab created from Process Chain Line (per Process) step 5-6, by clicking "Add name_of_process profile" button in the right-side corner of the Tab. Then, Mixing Profile will appear having 2 sections of it namely Machines/Equipment card and Process times card as seen in Figure 68. The **goal of this step is to create Process Timing Profiles for each Process of the Process Chain Line (per Process) that the Product in the Recipe Page** can

refer to in order to create a Production Schedule based of profile created Product in the **Scheduling Page.**

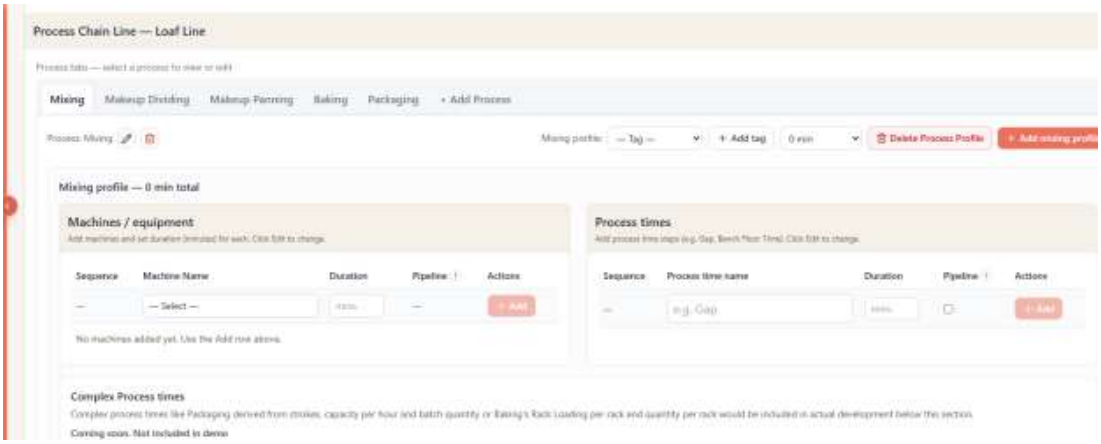

Figure 68: Production Page, Added New Process Profile of Mixing

Step 8: Still inside the Production Page & fill out Mixing Profile's Machine/Equipment card section w/the Process' (Selected Tab) Timing Variables. Upon clicking Machine Name field w/c is a dropdown, it will show list of Machines/Equipment as seen in Figure 69. This list is based on the populated Machines/Equipment Tab section in the topmost of Production Page beside the Production Tab as seen in Figure 70. In this tab, you can manage the Machines/Equipment Listing.

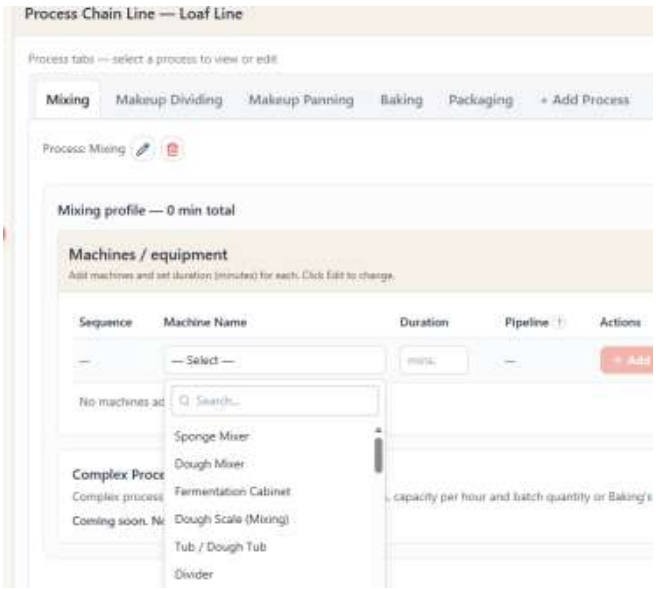

Figure 69: Machine/Equipment Section of Selected Process, List of Machines Dropdown

Figure 70: Machine/Equipment Tab Beside Production Tab that populates Machine Name

To create Timing Variables inside Machine/Equipment Section of Selected Process Tab from Process Chain Line (per Process), see Figure 71 how fields are filled. Upon adding Timing Variables inside the Machine/Equipment section of the Per Process Profile, you see that it's a table and its Columns are:

- **Sequence** – this column is important for this decides the sequence of Process Steps inside the Per Process Profile. The Sequence column's value are numerical & follows ascending logic, meaning, User doesn't just create Timing Variables but considers its flow inside Per Process Profile, in this case, Figure 71 is Mixing Process Profile. **This matters for Live View Page**.
- **Machine Name** – the values under this are based on the steps inside the Process where in case of Figure 71, The Mixing Process consist of having Sponge Mixing done via Sponge Mixer Machine, Fermentation Stage where Fermentation Cabinet is used & Mixing Time using Dough Scale for Mixing.

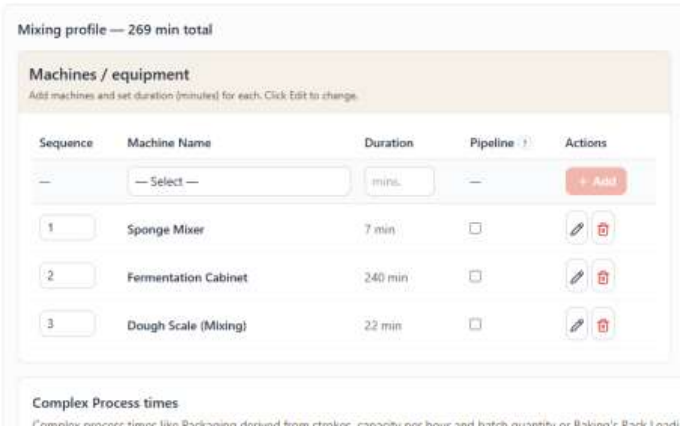

Figure 71: Machine/Equipment section of Process Profile filled

- **Duration** – the values under this are based on the steps inside the Process where in case of Figure 71, The Mixing Process consist of having Sponge Mixing done having 7 minutes process time, Fermentation Stage where process time is 240 minutes & Mixing Time around 22 minutes. This makes the current Total Timing of Per Process Profile (e.g. Mixing Profile Process) total of 267 minutes before proceeding on next Per Process Profile (e.g. Makeup Dividing).

Step 9: Still inside the Production Page & fill out Mixing Profile's Process times card section w/the Process' (Selected Tab) Timing Variables same on Step 8 but not Machines but Timing Variables that are not Machine/Equipment Influenced. In the Process time name, it's not a drop down but a text field where you have to name the process time depending on the User as seen in Figure 72 (e.g. Mixing Process has this "Gap" w/c is a waiting time). Timing Variables added in this section also is related to the Sequences of the Machine/Equipment section, meaning, User can declare a Timing Variable on this side to be Sequence #2 & that makes value 2 unable to be used again even on Machine/Equipment section (In our example Figure 71, 72, Mixing Profile's step sequence is Sponge Mixing then Gap then Fermentation Stage then Mixing time meaning we have to modify the Sequence # value of both section since its Sponge Mixing then Fermentation Stage then Mixing time then Gap w/c is wrong, See Figure 73).

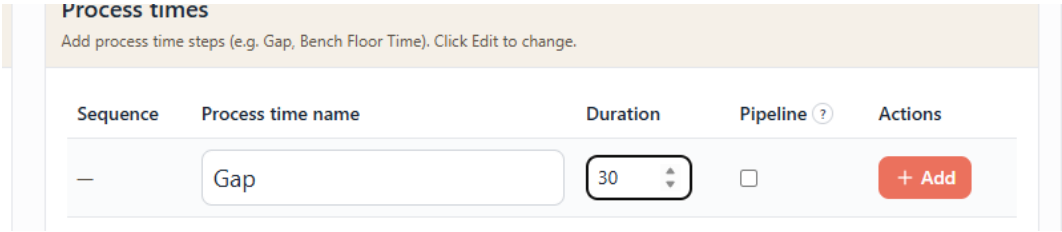

Figure 72: Process times section of Process Profile filled

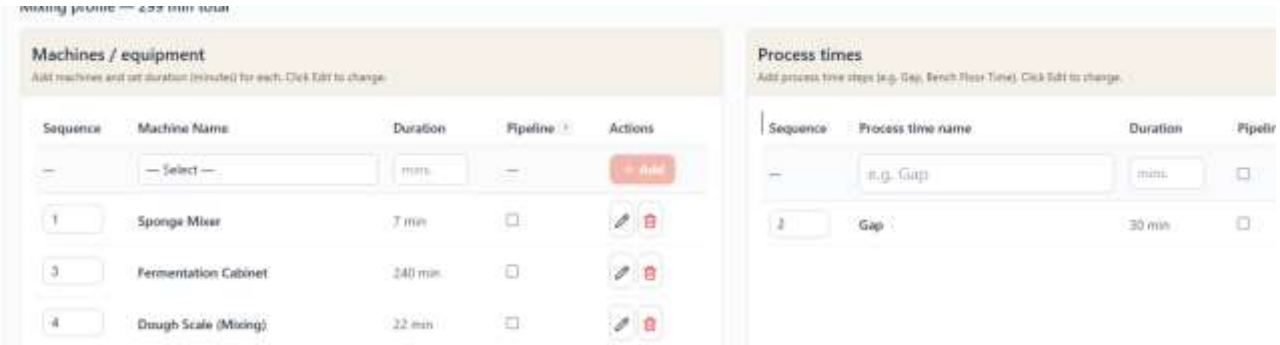

Figure 73: Machine/Equipment & Process times section Sequence Value Re-Arranged

In order to fully finish creating Per Process Profile Timing Variables (both Machine/Equipment and Process times section have same Columns, there are other Columns that have yet to be discussed on Step 8:

- **Pipeline** – this column contains checkbox(es) and it has tooltip (question mark icon) beside the Column Name to. This is important for this allows other Schedule Records to proceed running after this checked Pipeline Timing Variable is done, resulting in an overlapping run of Schedule Records w/o waiting for current Schedule Records to finish. Figure 74 shows an example that Gap Timing Variable under Process times would have its Pipeline Checkbox check because based on the Mixing Process, the Gap step is the start of accepting another batch to perform after it is done. It cascades created Schedules as seen in Figure 75 in Dashboard Page.
- **Actions** – Edit & Delete button to modify & remove Timing Variable added.

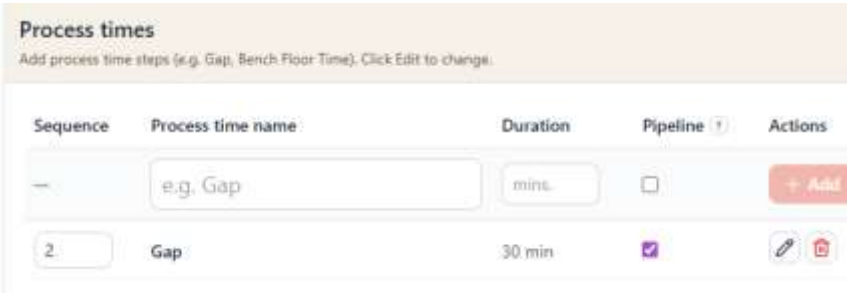

Figure 74: Machine/Equipment & Process times section Sequence Value Re-Arranged

Figure 75: Dashboard Page, Production Gantt Chart (Schedule Records Cascading)

Step 10: Still inside the Production Page & repeat Step 8 & 9 on Per Process Profile Tabs until all of these have Timing Variables that completes the Production Line's Process Chain Line (Per Process) depending on User's input and Product.

Step 11: Go to Recipe Page & edit the Product that now contains Process Chain Line (Per Process) e.g. in our example are valued 0 since the Product was created first w/o finishing the Process Chain Line (Per Process) as seen in Figure 76. Edit the Product e.g. Everyday Bread 8s Process Chain Line (Per Process) Time values until all have the set Timing based of the Process Profile of each Processes as seen in Figure 77. The Total Process Time Column is automatically computed summing up all the Timings of the Process Chain Line (Per Process).

Figure 76: Recipe Page, Everyday Bread 8s now having Processes that needs Editing

Figure 77: Recipe Page, Everyday Bread 8s Processes have all Edited

Mixing	Makeup Dividing	Makeup Panning	Baking	Packaging	Total Process Time	End Dough
299 min	27.5 min	90 min	172 min	25 min	10h 14m	Mixing

Figure 78: Recipe Page, Total Process Time & End Dough Columns

Step 12: Go to Scheduling Page & click "Add Schedule" button and a dialog will appear as seen in Figure 79. You will see three (3) tabs namely Quantity, Sales Order and By Others. In the Quantity Tab, select a Product to do a schedule batch(es) w/. If want to generate the schedule already, just fill out the Total Quantity and click "Add Batch". This will generate you an SKU having schedule batch(es) but w/o details e.g. Sales Order, SO-CO, Samples, Exchange for Loss, etc. as seen in Figure 80. If you wanted to generate a schedule of SKU having details, you have to go to Sales Order Tab and there you fill out everything you needed and if the Total Quantity in the Quantity Tab is "=0", the app

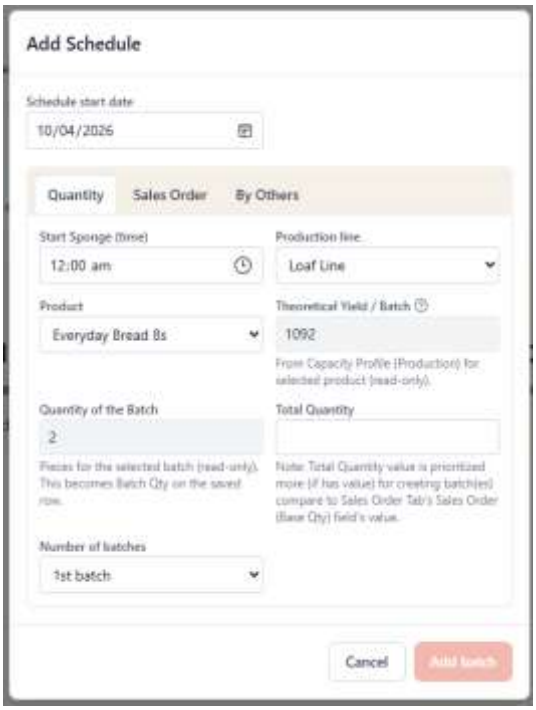

Figure 79: Add Schedule, Quantity Tab

will use the Sales Order (base qty) field in the Sales Order Tab for generating schedule batch(es) but if it has, it will use the Total Quantity in the Quantity Tab instead and the Sales Order (base qty) value in its field will still be recorded as its SKU's detail as seen in Figure 81.

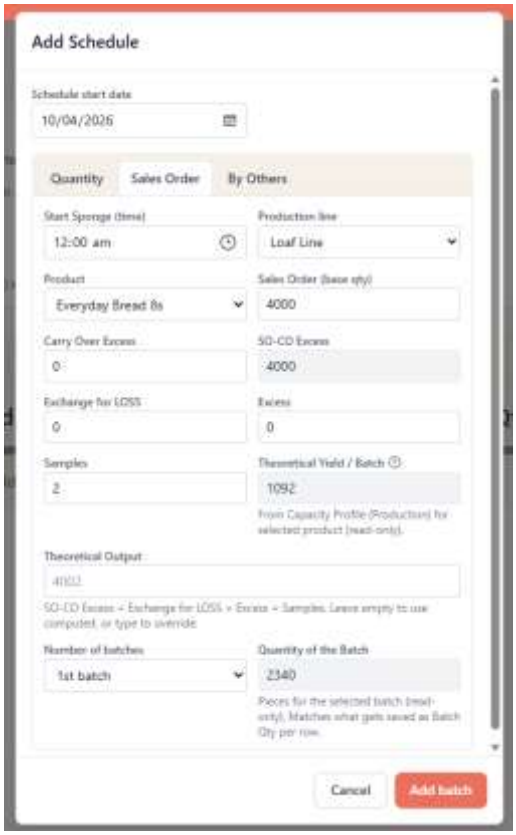

Figure 81: Sales Order Tab fields filled to generate Schedule's SKU w/ details

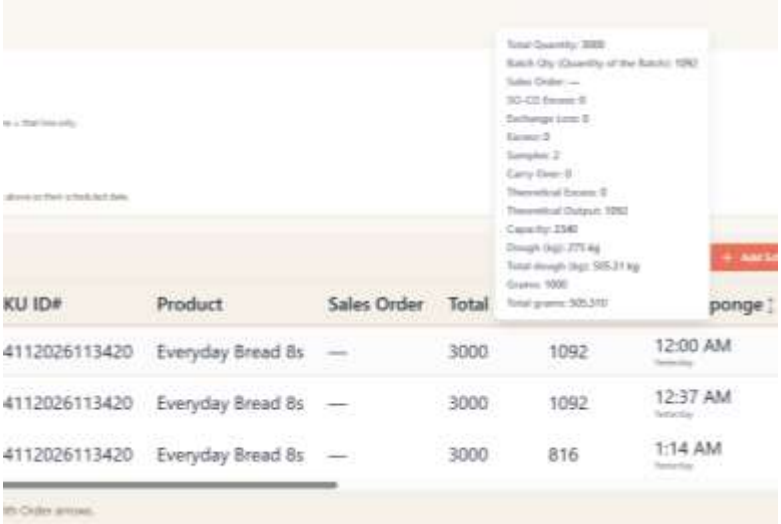

Figure 80: Scheduled Batch(es) using Quantity Tab fields only, No SKU details

Figure 82: Scheduled Batch(es) using Sales Order Tab fields only, w/ SKU details

Step 13: Go to Dashboard Page & Click the "Live View" button in the bottom right side of the page w/c is under the Production Line Schedule Table & it will redirect you to the Live View Page. The Live View Page redirection depends on what current Tab in the Production Line Schedule Table is currently selected. In Figure 83, currently, the Mixing Tab of the Production Line Profile Loaf Line is selected thus, clicking "Live View" button leads you to Live View Page for Mixing Process Line.

Figure 83: Production Line Schedule Table, Live View button bottom-right side

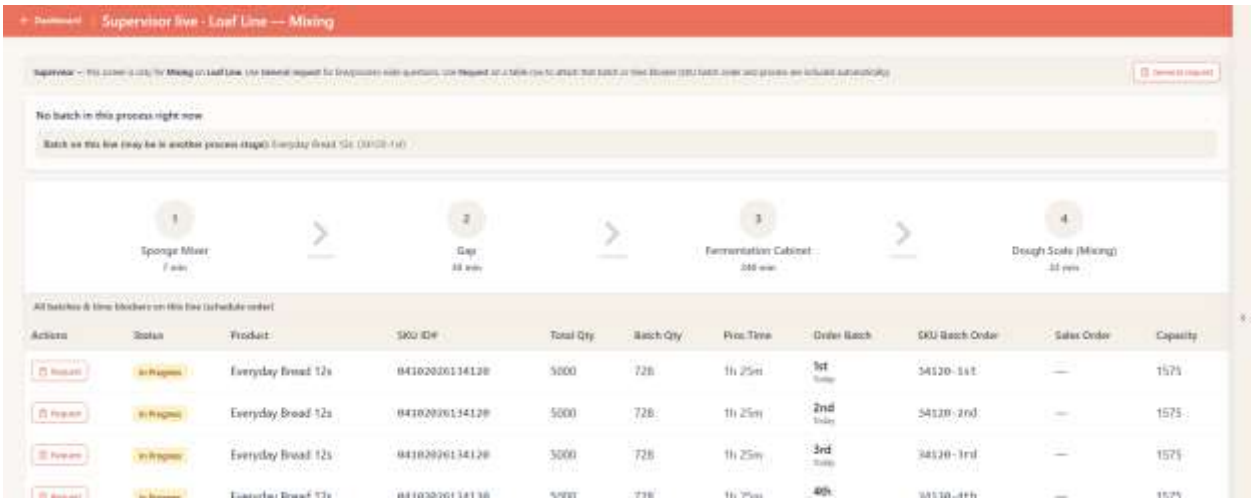

Figure 84: Live View Page (Depending on Selected Process for Live Viewing)

Step 14: Upon clicking General Request button, it will show a dialog containing a huge text field that the Supervisor can use to chat in details the Request regarding Process Line he is supervising as seen in Figure 85.

Sending the request will add that request in the My Request list found in the right-hand side of the Live View Page, having a chevron or arrow icon button on it where it is collapsible as seen in Figure 86. Here you can see the status of your request if it has been accepted or rejected.

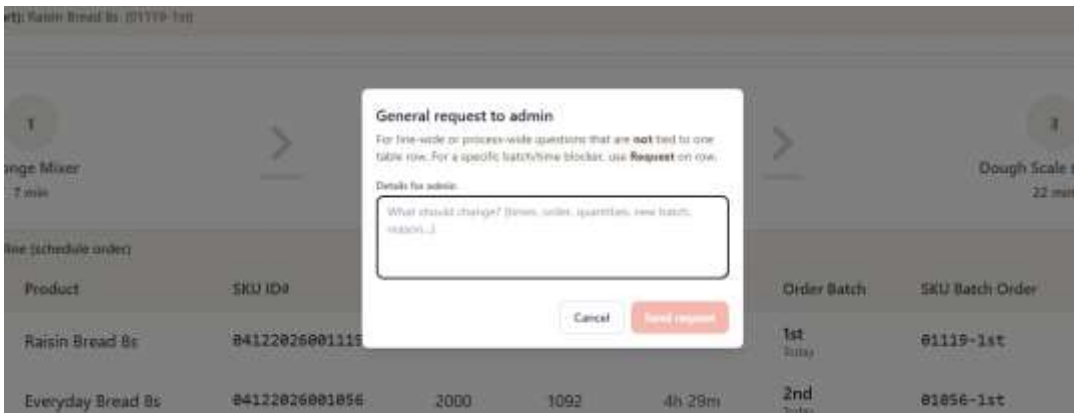

Figure 85: General Request Dialog

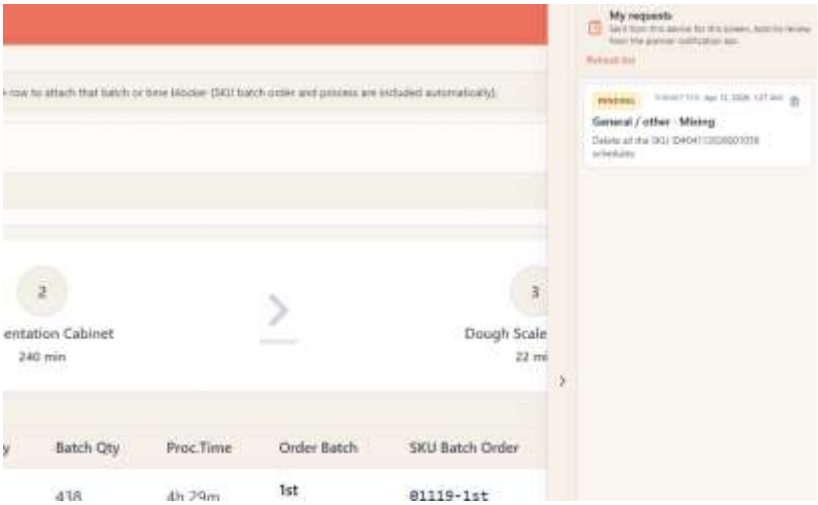

Figure 86: Request List for both General Request & Request per Schedule lies here

Step 15: Go to Dashboard Page & Click the "Notification Bell" icon in the top right side of the page & it will show list of Request Notifications (see Figure 88) from supposed Supervisors having access on the Live View Page (Per Process), though in actual development, there would be various notifications like finished schedule, update on schedule, etc. That Notification Bell would have an indicator on top of it, yellow circle w/how many notifications are not handled see Figure 87. The list in the Notification Bell upon click are clickable too as seen in Figure 88 & upon clicking the notification, you are to approve or reject it (for the Demo App, it will be just this but in actual development, it will be more than this approve/reject feature). Clicking the notification opens the Request dialog as seen in Figure 89.

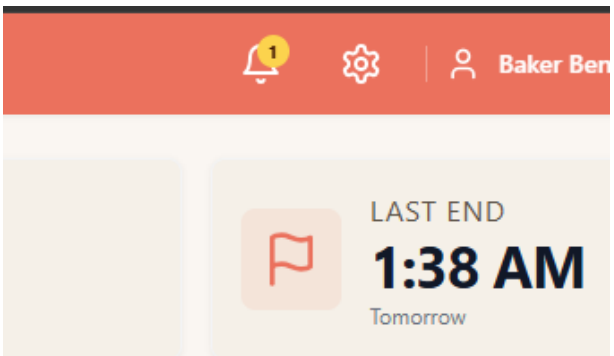

Figure 87: Notification Bell w/ Content

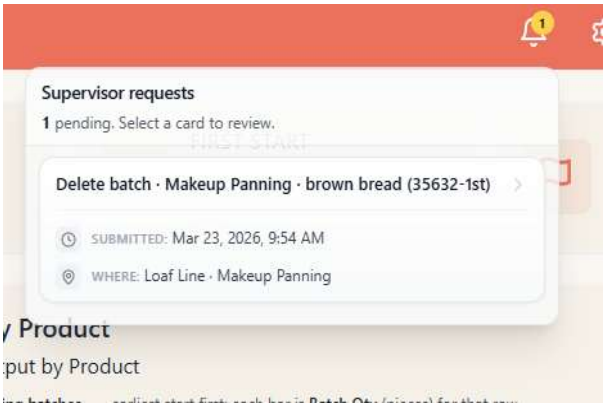

Figure 88: Notification inside Notif Bell

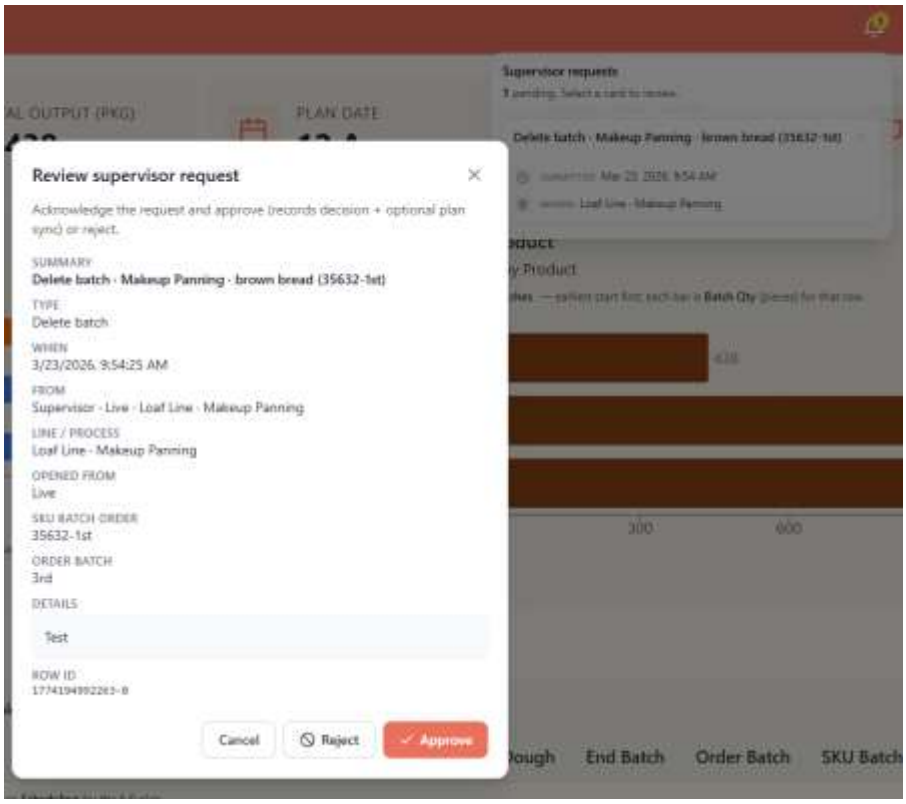

Figure 89: Production Line Schedule Table, Live View button bottom-right side

Step 16: Upon showing of Request Dialog, it's up for the User to click reject/approve or cancel to just deal w/ it later. Upon clicking approve, in the Demo App, the User is the one to do the request for the Supervisor but in actual, this would be automated or semi-automated. Since the Demo App is limited just for Proof-of-Concept (PoC) purposes only, features like Editing/Updating Schedules are not yet implemented nor other automations for such Supervisor Request. But this feature showcases the idea that the Live View Page for Supervisors depending on the Process Line can interact w/one another.

END/FINSIH
